ISTQB ISTQB-CTFL試験の準備方法 | 実用的なISTQB-CTFLテスト対策書試験 | 最高のISTQB Certified Tester Foundation Level (CTFL v4.0)模試エンジン

21世紀には、{Examcode}認定は受験者の特定の能力を表すため、社会でますます認知されるようになりました。ただし、{Examcode}認定を取得するには、ISTQB-CTFL試験の準備に多くの時間を費やす必要があります。ISTQB-CTFL模擬試験を購入すると、当社のウェブサイトはプロの技術を使用してすべてのユーザーのプライバシーを暗号化し、ハッカーの盗用を防ぎます。私たちは、ビジネスがお客様のために十分に考慮された場合のみ継続できると考えているため、当社の評判を損なうような行為は一切行いません。ISTQB-CTFL試験問題に完全な信頼を寄せていただければ幸いです。失望することはありません。

ISTQB Certified Tester Foundation Level (CTFL v4.0) 認定 ISTQB-CTFL 試験問題 (Q261-Q266):

質問 # 261

A test score indicator for students produces a performance score based on a combination of the number of consecutive hours studied (below 4 hours, 4 to 8 hours, 9 to 12 hours or above 12 hours) and the average intensity of focus on the material during the study time (low, medium or high).

Given the following test cases:

hours intensity score

T1 3 low55

T2 14 high 95

T3 9 low75

What is the minimum number of additional test cases that are needed to ensure full coverage of all valid INPUT equivalence partitions?

- A. 0
- B. 1
- C. 2
- D. 3

正解: A

解説:

Considering the various valid input equivalence partitions of hours studied and intensity, three additional test cases are needed to fully cover all valid partitions. This would typically include testing combinations that vary both the number of hours and the intensity levels not covered by the initial test cases(ISTQB Main Web).

質問 # 262

Which ONE of the following options MOST ACCURATELY describes the activities of "testing" and "debugging"?

- A. Testing triggers a defect that is caused by an error in the software, whereas debugging is concerned with finding the causes of this defect, analyzing these causes, and eliminating them.
- B. Testing triggers a failure that is caused by a defect in the software, whereas debugging is concerned with finding the causes of this failure (defects), analyzing these causes, and eliminating them.
- C. Testing triggers a failure that is caused by a defect in the software, whereas debugging is concerned with finding the causes of this failure (defects), analyzing these causes, and reproducing them.
- D. Testing identifies a defect that is caused by an error in the software, whereas debugging is concerned with finding the causes of this defect, analyzing these causes, and eliminating them.

正解: B

解説:

Comprehensive and Detailed In-Depth Explanation: Testing and debugging are separate but related activities. Testing executes the software to identify failures that result from defects (A). Debugging is the developer's responsibility and involves finding the cause of a failure (defect), analyzing it, and fixing the defect. The ISTQB syllabus explicitly differentiates these activities. Testing does not modify the software, whereas debugging does.

質問 # 263

An Incident Management tool implements the following defect states; Open, Assigned, Solved, Closed Consider the following defect report:

Id T000561

Test Object 'Warehouse Management' application

Tester name; John Bishop

Date: 10th. April 2010

Test Case MRT558I

Status OPEN

Severity Serious

Priority

Problem- After inputting the Total Quantity item = 450 in the SV034 screen, the system shows an unexpected Error message=47

Correction:

Developer name:

Closing date:

Which of the following is a valid criticism of this report?

- A. The Priority, the Correction description and the Developer name are missing
- B. There is no link to the applicable requirement (traceability)
- C. The version of the application is missing
- D. The description is not highlighting the source of the problem

正解: C

解説:

A valid criticism of this report is that the version of the application is missing. The version of the application is an important piece of information that should be included in a defect report, as it helps to identify which release or build of the software product contains the defect. The version of the application can also help to reproduce and debug the defect, as different versions may have different behaviors or features. The other options are not valid criticisms of this report. The priority, the correction description and the developer name are not missing, but rather not applicable for this report. The priority is a measure of how urgently a defect needs to be fixed, which can be assigned by the project manager or the defect tracking system, not by the tester who reports the defect. The correction description and the developer name are information that are added after the defect has been resolved, not when it has been reported. There is no link to the applicable requirement (traceability) is not a valid criticism of this report, because traceability is not a mandatory attribute of a defect report, but rather an optional one. Traceability is a relationship between two or more entities (such as requirements, test cases, defects, etc.) that shows how they are related or dependent on each other. Traceability can help to verify that the requirements are met by the test cases and defects, but it is not essential for reporting a defect. The description is not highlighting the source of the problem is not a valid criticism of this report, because highlighting the source of the problem is not a responsibility of the tester who reports the defect, but rather of the developer who fixes the defect. The description should provide enough information to describe what happened when the defect occurred, such as input values, expected results, actual results, error messages, screenshots, etc., but it does not need to explain why or how it happened. 質問 # 264

Your manager asked you when testing will be complete. In order to answer this question, you'll most likely use:

- A. Your colleagues advice
- B. Test progress reports
- C. A Test Oracle
- D. A conversion spreadsheet

正解: B

解説:

When a manager asks when testing will be complete, the most appropriate and informative resource to provide an answer is test progress reports (Option A). Test progress reports contain detailed information on the status of testing activities, including what has been accomplished, what remains to be done, the results of the tests conducted, and any issues or risks that might impact the completion of testing. These reports allow for an informed assessment of the testing progress and estimation of when testing might be completed.

Options B, C, and D do not provide the structured, detailed, and specific information required to accurately answer the manager's question about the completion of testing.

質問 # 265

Which of the following statements about decision tables are TRUE?

- I. Generally, decision tables are generated for low risk test items.
- II. Test cases derived from decision tables can be used for component tests.
- III. Several test cases can be selected for each column of the decision table.
- IV. The conditions in the decision table represent negative tests generally.

- A. I. III
- **B. II. III**
- C. II. IV
- D. I, IV

正解: B

解説:

A decision table is a technique that shows combinations of inputs and/or stimuli (causes) with their associated outputs and/or actions (effects). A decision table consists of four quadrants: conditions (inputs), actions (outputs), condition entries (values) and action entries (results). The following statements about decision tables are true:

* II. Test cases derived from decision tables can be used for component tests. Decision tables can be used to test components that have multiple inputs and outputs that depend on logical combinations of conditions. Decision tables can help cover all possible combinations or scenarios in a systematic way.

* III. Several test cases can be selected for each column of the decision table. A column of a decision table represents a unique combination of condition entries and action entries. Several test cases can be selected for each column by varying other input values or expected results that are not part of the decision table. The following statements about decision tables are false:

* I. Generally, decision tables are generated for low risk test items. Decision tables are not related to risk level, but rather to complexity level. Decision tables are generated for test items that have complex logic or multiple conditions and actions that need to be tested.

* IV. The conditions in the decision table represent negative tests generally. The conditions in the decision table represent both positive and negative tests, depending on whether they are valid or invalid inputs for the test item.
