100% Pass Quiz Medical Technology - Latest PTC-AMCA - New AMCA Phlebotomy Technician Certification Exam Test Registration

Test4Engine provides numerous extra features to help you succeed on the PTC-AMCA exam, in addition to the Medical Technology PTC-AMCA exam questions in PDF format and online practice test engine. These include 100% real questions and accurate answers, 1 year of free updates, a free demo of the Medical Technology PTC-AMCA Exam Questions, a money-back guarantee in the event of failure, and a 20% discount. Test4Engine is the ideal alternative for your PTC-AMCA test preparation because it combines all of these elements.

Medical Technology AMCA Phlebotomy Technician Certification Exam Sample Questions (Q251-Q256):

NEW QUESTION # 251

Withdrawing blood from a VAD for noncoagulation studies requires:

- **A. Flushing the VAD with preservative-free NS and drawing a discard tube first**

- B. Flushing the VAD with preservative-free NS before withdrawing blood
- C. Waiting at least 60 minutes after a heparin flush before withdrawing blood
- D. Drawing a discard tube before withdrawing blood

Answer: A

Explanation:

Withdrawing blood from a vascular access device (VAD) for coagulation studies requires flushing the VAD lock with 5-10 mL preservative-free normal saline (NS) and drawing a discard tube, equal to $W.ro$ times the dead space, before drawing the sample. For most central lines, 5 mL is adequate as the discard volume, although this may vary so the discard volume needed should always be verified. For coagulation studies, typically a discard volume of six times the dead space is recommended, although if drawing blood from a saline lock a discard volume of two times the dead space is adequate. After the specimen is obtained, the VAD is again flushed with 5-10 mL of preservative-free NS.

NEW QUESTION # 252

In a patient with an IV, blood should NOT be drawn:

- A. From a different vein
- B. Below the IV
- C. Above the IV
- D. By capillary puncture

Answer: C

Explanation:

In a patient with an IV, blood should never be drawn from a site above the IV, as the specimen may become contaminated with IV fluid, causing erroneous test results. Venipuncture can be performed at a site distal to the IV, in a different vein than the one with the IV, or by capillary puncture.

NEW QUESTION # 253

The greatest risk when a tube breaks during centrifugation is:

- A. Lacerations/Puncture wounds
- B. Electric shock
- C. Equipment damage
- D. Aerosolization of sample

Answer: D

Explanation:

The greatest risk when a tube breaks during centrifugation is aerosolization of the specimen because the spinning specimen breaks down into droplets, which can be easily inhaled or can land on exposed skin, increasing risk of infection. Aerosolization can also occur if collection tubes are overfilled or if the caps come off during processing. Additionally, care must be used if removing a cap after centrifugation. Buckets, tubes, and rotors should be carefully spaced and balanced before centrifugation.

NEW QUESTION # 254

Which of the following is NOT a reason to avoid removing stoppers from blood specimen tubes prior in the precentrifugation period?

- A. To prevent concentration of the specimen
- B. To prevent contamination
- C. To prevent a loss of CO₂
- D. To prevent a decrease in pH

Answer: D

Explanation:

Removing the stoppers from blood specimen tubes during the precentrifugation period can result in an increase-not a decrease-of

pH because of a loss of carbon dioxide (COD). Other problems that may occur if a stopper is removed are due to evaporation of the specimen, which can result in concentration and possibly alter the test results. An opened specimen container also always runs the risk of contamination. Containers should be maintained in an upright position with the stoppers in place.

NEW QUESTION # 255

A fire caused by the splashing of hot grease from a frying pan is classified as a:

- A. Class D fire
- B. Class A fire
- C. Class K fire
- D. Class B fire

Answer: C

Explanation:

Class K fires are often caused by high-temperature cooking oils, grease, or fats. Class A fires occur with wood, paper, or clothing. Class B fires occur with flammable liquids and vapors, such as paint or gasoline. Class D fires are associated with combustible or reactive metals such as sodium or potassium.

NEW QUESTION # 256

.....

You can also trust Medical Technology PTC-AMCA exam questions and start Medical Technology PTC-AMCA exam preparation. With the Medical Technology PTC-AMCA valid dumps you can get an idea about the format of real Medical Technology PTC-AMCA Exam Questions. These latest Medical Technology PTC-AMCA questions will help you pass the AMCA Phlebotomy Technician Certification Exam PTC-AMCA exam.
