

# Valid CKA Exam Sims | CKA Test Dumps Demo

What's more, part of that ExamsReviews CKA dumps now are free: [https://drive.google.com/open?id=1A35QMBv\\_b3pfsaMhbZHCn1JwY9nyVVL](https://drive.google.com/open?id=1A35QMBv_b3pfsaMhbZHCn1JwY9nyVVL)

We have a lot of regular customers for a long-term cooperation now since they have understood how useful and effective our CKA actual exam is. In order to let you have a general idea about the shining points of our CKA training materials, I would like to introduce the free demos of our CKA study engine for you. There are the real and sample questions in the free demos to show you that how valid and latest our CKA learning dumps are. So just try now!

Linux Foundation Certified Kubernetes Administrator (CKA) Program Certification Exam is designed to test the skills and knowledge of individuals in the field of Kubernetes administration. CKA exam is aimed at individuals who are responsible for designing, deploying, and maintaining Kubernetes clusters in production environments. The CKA Program Certification Exam is a performance-based exam, which means that candidates will be required to perform tasks on a live Kubernetes cluster rather than answering multiple-choice questions.

## CKA Test Dumps Demo | CKA Test Torrent

If you choose the test CKA certification and then buy our CKA study materials you will get the panacea to both get the useful certificate and spend little time. Passing the test certification can help you stand out in your colleagues and have a bright future in your career. If you buy our CKA Study Materials your odds to pass the test will definitely increase greatly.

## Linux Foundation Certified Kubernetes Administrator (CKA) Program Exam Sample Questions (Q34-Q39):

### NEW QUESTION # 34

Create a busybox pod that runs the command "env" and save the output to "envpod" file

**Answer:**

Explanation:

See the solution below.

Explanation

```
kubectrl run busybox --image=busybox --restart=Never --rm -it -- env > envpod.yaml
```

### NEW QUESTION # 35

You have a complex application with multiple services running in a Kubernetes cluster. Some services communicate with each other over the cluster network, while others need to access external services over the internet. You need to configure CoreDNS to handle both internal and external DNS resolution in a secure and efficient manner.

#### Answer:

Explanation:

See the solution below with Step by Step Explanation.

Explanation:

Solution (Step by Step) :

1. Configure CoreDNS for Internal DNS:

- Create a CoreDNS ConfigMap named 'coredns' with the following configuration:

-

2. Configure CoreDNS for External DNS: - If you need to resolve external domains, you can use CoreDNS's 'forward' plugin to forward requests to external DNS servers. You can configure 'forward' in the Corefile, or use environment variables to dynamically set the upstream servers.

3. Configure Services with External Names: - If you need to access external services, configure their services in Kubernetes with the 'externalName' field.

4. Use Secure DNS: - Enable DNS over TLS (DOT) or DNS over HTTPS (DOH) in your CoreDNS configuration to ensure secure DNS resolution.

5. Test DNS Resolution: - Test DNS resolution for internal and external domains using the 'nslookup' command from pods in your cluster.

### NEW QUESTION # 36

Check the history of deployment

#### Answer:

Explanation:

kubectl rollout history deployment webapp

### NEW QUESTION # 37

You have a Deployment named 'worker-deployment' that runs a set of worker Pods. You need to configure a PodDisruptionBudget (PDB) for this deployment, ensuring that at least 60% of the worker Pods are always available, even during planned or unplanned disruptions. How can you achieve this?

#### Answer:

Explanation:

See the solution below with Step by Step Explanation.

Explanation:

Solution (Step by Step) :

1. PDB YAML Definition:

2. Explanation: - 'apiVersion: policy/v1' : Specifies the API version for PodDisruptionBudget resources. - 'kind: PodDisruptionBudget': Specifies that this is a PodDisruptionBudget resource. - 'metadata.name: worker-pdb': Sets the name of the PDB. - 'spec.selector.matchLabels: app: worker': This selector targets the Pods labeled with 'app: worker', ensuring the PDB applies to the 'worker-deployment' Pods. - 'spec.minAvailable: 60%': Specifies that at least 60% of the total worker Pods must remain available during disruptions. This means that if your deployment has 5 replicas, at least 3 Pods must remain running. 3. How it works: - The 'minAvailable' field in the PDB can be specified as a percentage of the total number of Pods in the deployment or as an absolute number of Pods. In this case, we are using a percentage ('60%/0') to ensure a flexible approach to maintaining availability, even if the number of replicas changes. 4. Implementation: - Apply the YAML using 'kubectl apply -f worker-pdb.yaml' 5.

Verification: You can verify the PDB's effectiveness by trying to delete Pods or simulating a node failure. The scheduler will prevent actions that would violate the 'minAvailable' constraint, ensuring that at least 60% of the worker Pods remain available.

### NEW QUESTION # 38

Change the label for one of the pod to env=uat and list all the pods to verify

**Answer:**

Explanation:

```
kubectl label pod/nginx-dev3 env=uat --overwrite kubectl get pods --show-labels
```

## NEW QUESTION # 39

.....

The goal of CKA preparation material is to help applicants prepare for the Certified Kubernetes Administrator (CKA) Program Exam certification exam by providing them with the Actual CKA Exam Questions they need to pass the exam. This Certified Kubernetes Administrator (CKA) Program Exam (CKA) study material is in the form of practice tests and CKA PDF that thoroughly covers the content of the test.
