

100% Pass Updated AACN - CCRN-Pediatric Reliable Test Simulator

CCRN PRACTICE QUESTIONS AND ANSWERS GRADED 100% PASS 2024-2025 UPDATED LATEST.

Which ventilator setting will augment spontaneous breaths by decreasing resistance upon inspiration? - **Solution** Pressure support

A nurse is caring for a patient with an acute inferior wall MI, post PCI. For optimal care, what should the nurse do? - **Solution** Continuously monitor the orient in lead II

A patient with aortic regurgitation will have which murmur heard during auscultation - **Solution** A diastolic murmur

Regurgitation is the backflow of blood during the time the valve should be _____ - **Solution** Closed

Stenosis occurs when the valve is narrowed and _____ - **Solution** Open

What is the valvular function during systole? - **Solution** Mitral/tricuspid valves are closed while aortic/pulmonic valves are open

What is the valvular function during diastole? - **Solution** Mitral/tricuspid valves are open while aortic/pulmonic valves are closed

Cardiogenic shock secondary to LV failure will generally result in: - **Solution** A narrow pulse pressure

A patient was admitted with an acute inferior wall STEMI. The nurse monitors for RV infarction. What are signs of RV infarction? - **Solution** Distended neck veins and clear lungs

An effect of hypothermia includes? - **Solution** A shift of the oxyhemoglobin dissociation curve to the left

What can lead to cardiopulmonary arrest for a patient with status asthmaticus? - **Solution** Air trapping

In order to help customers solve the problem, our Critical Care Nursing Exam test torrent support the printing of page. We will provide you with three different versions, the PDF version allow you to switch our CCRN-Pediatric study torrent on paper. You just need to download the PDF version of our CCRN-Pediatric Exam Prep, and then you will have the right to switch study materials on paper. We believe it will be more convenient for you to make notes. Our website is very secure and regular platform, you can be assured to download the version of our CCRN-Pediatric study torrent.

AACN CCRN-Pediatric Exam is a computer-based test that is administered at Pearson VUE testing centers throughout the United States. Nurses who wish to take the exam must meet certain eligibility requirements, including holding a current and unrestricted RN license, completing a minimum of 1,750 hours of direct pediatric critical care within the past two years, and completing 25 hours of continuing education in pediatric critical care nursing within the past two years. These requirements ensure that nurses who take the exam have significant experience and knowledge in pediatric critical care nursing.

Updated AACN CCRN-Pediatric Exam Questions for CCRN-Pediatric Exam Success

Our CCRN-Pediatric practice braindumps beckon exam candidates around the world with our attractive characters. Our experts made significant contribution to their excellence of the CCRN-Pediatric study materials. So we can say bluntly that our CCRN-

Pediatric simulating exam is the best. Our effort in building the content of our CCRN-Pediatric learning questions lead to the development of learning guide and strengthen their perfection.

AACN Critical Care Nursing Exam Sample Questions (Q88-Q93):

NEW QUESTION # 88

Following placement of a central venous catheter, a mechanically ventilated child develops acute tachycardia, hypotension, and arterial desaturation. A nurse should evaluate the need for:

- A. An increase in the ventilator rate
- **B. Insertion of a chest tube**
- C. An IV fluid bolus
- D. Administration of a sedative

Answer: B

Explanation:

Central venous catheter placement can lead to iatrogenic pneumothorax, particularly on the side of the subclavian or internal jugular access. Signs of sudden desaturation, hypotension, and tachycardia suggest tension pneumothorax, which requires emergent chest tube insertion.

"Following central line placement, sudden cardiorespiratory compromise should prompt evaluation for pneumothorax. Treatment is immediate decompression and chest tube placement." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Air Leak Syndromes and Ventilator Complications)

NEW QUESTION # 89

When evaluating the effectiveness of a new skin care protocol, a nurse should assess the:

- A. Change in nursing care hours
- **B. Presence of lesions, ulcers, or erythema**
- C. Preventive measures implemented
- D. Documentation of nursing interventions

Answer: B

Explanation:

When evaluating the effectiveness of a clinical intervention like a skin care protocol, you measure outcomes- not the process. In this context, the presence or absence of skin breakdown, including ulcers or erythema, reflects patient-centered results and effectiveness.

"The presence of pressure injuries, ulcers, or erythema is a measurable outcome used to evaluate the efficacy of skin care protocols." (Referenced from CCRN Pediatric - Direct Care: Integumentary, Skin Integrity and Prevention of Pressure Injuries)

NEW QUESTION # 90

For a patient with pulmonary aspiration, PEEP is used to:

- A. Decrease PIP
- B. Decrease functional residual capacity
- C. Decrease airway obstruction
- **D. Improve oxygenation**

Answer: D

Explanation:

Positive End-Expiratory Pressure (PEEP) helps keep alveoli open at end-expiration, thereby increasing functional residual capacity and improving gas exchange. In aspiration-related lung injury, alveolar collapse and inflammation impair oxygenation, so PEEP is used to recruit alveoli and improve oxygenation.

"PEEP increases oxygenation by preventing alveolar collapse, especially important in aspiration pneumonia and ARDS. It improves oxygen delivery while minimizing barotrauma." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Mechanical Ventilation Strategies)

NEW QUESTION # 91

During a discussion with a group of mother, the nurse informs that scoliosis is most notable when a child reaches the age of:

- A. 7-9 years
- **B. 10-12 years**
- C. 15-18 years
- D. 3-6 years

Answer: B

Explanation:

Explanation: Preadolescence is the time when scoliosis is most likely to become evident. Although scoliosis may occur at any age like in the case of idiopathic scoliosis, the most common type tends to become evident during preadolescent years.

NEW QUESTION # 92

A 7-week-old infant was admitted after 2 days of vomiting. She was diagnosed of hypertrophic pyloric stenosis. The nurse at the emergency room knows that the most important nursing assessment is the:

- **A. amount and color of urine, skin turgor and respirations**
- B. presence of olive shaped mass in the hypogastric area
- C. amount of milk and water taken at the time of last feeding
- D. amount, frequency, and character of vomiting.

Answer: A

Explanation:

Explanation: If an infant has dark scanty urine, poor skin turgor, and increased depth of respirations then dehydration and metabolic alkalosis are present. It happens due to fluid and hydrochloric acid loss and the depletion of Potassium.

NEW QUESTION # 93

.....

Moreover, it is portable enabling you to prepare for the AACN CCRN-Pediatric exam from everywhere and at any time. You will find another convenience to make notes on AACN CCRN-Pediatric files combined with the facility to print them out. The CCRN-Pediatric Dumps PDF format can turn your preparation systematic and hassle-free. It will function smoothly on all smart devices.
