100% Pass 2026 Cisco Newest Reliable 300-720 Exam Camp

All questions on our 300-720 exam questions are strictly in accordance with the knowledge points on newest test syllabus. Also, our experts are capable of predicating the difficult knowledge parts of the 300-720 exam according to the test syllabus. We have tried our best to simply the difficult questions of our 300-720 Practice Engine to be understood by the customers all over the world. No matter the students, office staffs, even someone who know nothing about this subject can totally study it without difficulty.

The Cisco 300-720 Exam is ideal for IT professionals who work in organizations that use Cisco Email Security Appliance to protect their email systems from cyber threats. It covers a range of topics such as configuring policies, message filters, and data loss prevention. It also includes advanced topics such as advanced malware protection, email encryption, and email authentication.

Cisco Securing Email with Cisco Email Security Appliance Sample Questions (Q121-Q126):

NEW QUESTION # 121

What validates users via LDAP during login to end-user quarantine?

- A. end-user authentication query
- B. LDAP authentication query

- C. external authentication query
- D. alias consolidation query

Answer: C

NEW QUESTION # 122

Which feature must be configured before an administrator can use the outbreak filter for nonviral threats?

- A. data loss prevention
- B. antispam
- C. quarantine threat level
- D. antivirus

Answer: B

Explanation:

The feature that must be configured before an administrator can use the outbreak filter for nonviral threats is antispam. The outbreak filter relies on the antispam engine to detect and block nonviral threats, such as phishing, malware, or spam campaigns. You need to enable antispam scanning and configure the antispam settings before you can use the outbreak filter.

NEW QUESTION # 123

Refer to the exhibit.

A network engineer must set up a content filter to find any messages that failed SPF and send them into quarantine. The content filter has been set up and enabled, but all messages except those that have failed SPF are being sent into quarantine. Which section of the filter must be modified to correct this behavior?

- A. skip-filters
- B. quarantine
- C. spf-status
- D. log-entry

Answer: C

Explanation:

spf-status is the section of the filter that must be modified to correct this behavior. spf-status is a condition that determines whether a message matches the content filter rule based on the result of SPF verification, such as pass, fail, neutral, etc.

The content filter in the exhibit has a spf-status condition set to "Pass", which means that it will match messages that passed SPF verification and apply the action of "Quarantine". This is the opposite of what the network engineer intended to do.

To correct this behavior, the network engineer can modify the spf-status condition to "Fail", which means that it will match messages that failed SPF verification and apply the action of "Quarantine".

The other options are not valid sections of the filter that must be modified to correct this behavior, because they do not affect the spf-status condition.

References: [User Guide for AsyncOS 15.0 for Cisco Secure Email Gateway], page 8-3 and page 8-4.

NEW QUESTION # 124

Which content filter condition checks to see if the "From: header" in the message is similar to any of the users in the content dictionary?

- A. Subject Header
- B. Forged Email Detection
- C. SPF Verification
- D. Duplicate Boundaries Verification

Answer: B

Explanation:

The content filter condition that checks to see if the "From: header" in the message is similar to any of the users in the content dictionary is Forged Email Detection. This condition compares the sender's name or email address with a list of names or email

addresses in a content dictionary and triggers an action if they match or are similar. References : [Cisco Secure Email Gateway Administrator Guide - Forged Email Detection]

NEW QUESTION # 125

A content dictionary was created for use with Forged Email Detection. Proper data that pertains to the CEO Example CEO: <ceo@example.com> must be entered. What must be added to the dictionary to accomplish this goal?

- A. ceo
- B. example.com
- C. Example CEO
- D. ceo@example.com

Answer: D

Explanation:

ceo@example.com is the data that must be added to the dictionary to accomplish this goal. A content dictionary is a list of values that can be used as a condition in a content filter or a message filter. Forged Email Detection is a feature that allows Cisco ESA to detect and prevent email spoofing attacks, where the sender's address or domain is forged to appear as someone else, such as the CEO of the organization.

To create a content dictionary for use with Forged Email Detection on Cisco ESA, the administrator can follow these steps:

Select Mail Policies > Content Dictionaries and click Add Dictionary.

Enter a name and description for the content dictionary, such as CEO Email.

Under Dictionary Values, click Add Value.

Enter the email address of the CEO, such as ceo@example.com.

Click Submit.
