## VMware vSphere 8.x Advanced Design Sample Questions (Q81-Q86):

### NEW QUESTION # 81

An architect is reviewing a physical storage design. The customer has specified that a new active- passive based storage array will be used to provide storage for the vSphere clusters.

Which configuration should for the architect recommended?

- A. VMW\_SATP\_DEFAULT\_AA
- B. VMW\_SATP\_LOCAL
- C. VMW\_PSP\_FIXED
- D. VMW\_PSP\_MRU

**Answer: D**

### NEW QUESTION # 82

An architect is designing a new VMware software-defined data center (SDDC) that will consist of 100 branch sites connected to a single VMware vCenter Server within the primary data center. To allow for the use of existing automation scripts, there is a requirement to replicate the names of the virtual distributed port groups across all sites. The procurement team purchases licensing and there is no further budget allocated.

Which design decision should the architect make to meet this requirement?

- A. A new vCenter Server will be deployed for each branch site
- B. A new virtual data center will be created for each branch site
- C. The automation script will be updated to reflect unique naming for each site
- D. A new host and cluster folder will be created for each branch site

**Answer: B**

### NEW QUESTION # 83

The architect for a large enterprise is tasked with reviewing a proposed design created by a service partner.

Which design elements are expected to be detailed within the physical design section of the documentation?

- A. A design diagram illustrating the configuration and specific attributes, such as IP addresses
- B. A list of requirements, constraints, and risks
- C. A solution architecture diagram with the components and data flow
- D. An entity relationship diagram describing upstream and downstream dependencies for specific service components

**Answer: A**

Explanation:

The physical design is based on the logical design. The physical design includes specific hardware from specific vendors. This design also lists specific configurations for each of the components that are deployed.

### NEW QUESTION # 84

Following a recent acquisition, the architect learns that both companies use vSphere on-premise and will need to combine the data centers into one. The acquired company's licenses will not be renewed for cost-savings related to the acquisition. All consumed vSphere licenses must have active support to support line-of-business operations. The merged environment must maintain 25% spare capacity. The architect has a small budget remaining unallocated for hardware.

The architect has calculated that the current vSphere environment can absorb the acquired company's virtual machines but the cluster will run at 90% memory utilization and at 50% CPU utilization.

Which design decision can the architect make to incorporate the new company's virtual machines into the combined vSphere environment?

- A. Purchase extra hosts to add to the cluster in anticipation of adding the acquired company's virtual machines.
- B. Migrate the acquired company's virtual machines into the vSphere environment as it will currently fit.
- C. Purchase new licenses for some of the acquired company's ESXi hosts and add them to the cluster to hold the acquired

company's virtual machines.

- **D. Use the current budget to add memory to the cluster to increase each ESXi host's capacity and add the new virtual machines.**

**Answer: D**

Explanation:

A wrong because must maintain 25% spare capacity.

C wrong, extra host need new license and new hardware, large budget require D wrong because The acquired company's licenses will not be renewed for cost-savings related to the acquisition.

### **NEW QUESTION # 85**

An architect is tasked with designing the VMware Validated Solutions in an existing VMware Cloud Foundation environment.

The design must meet the following requirements:

Must not allow logical networks to span physical network boundaries or locations Must support static routing What should the architect recommend based on these requirements?

- A. Overlay-backed NSX segments
- B. A dedicated NSX segment configured manually
- C. A dedicated distributed virtual switch and dedicated port groups
- **D. VLAN-backed NSX segments**

**Answer: D**

Explanation:

VLAN-backed NSX segments meet the requirement of ensuring that logical networks do not span physical network boundaries because VLANs are inherently limited to a single physical network segment. Each VLAN maps to a specific Layer 2 broadcast domain and can be isolated to particular physical network segments, ensuring that no logical network spans across physical boundaries. Additionally, static routing is supported with VLAN-backed segments, providing the flexibility needed to configure routing between different subnets or networks.
