Vce Copado-Extension-Builder Format, Copado-Extension-Builder Reliable Braindumps Questions

Copado Certified Extension Builder Copado-Extension-Builder exam practice material is available in desktop practice exam software, web-based practice test, and PDF format. Choose the finest format of Copado Certified Extension Builder Copado-Extension-Builder exam questions so that you can prepare well for the Copado Certified Extension Builder exam. Our Copado-Extension-Builder PDF exam questions are an eBook that can be read on any device, even your smartphone.

Copado Certified Extension Builder Sample Questions (Q24-Q29):

NEW QUESTION # 24

What information will you find in the Copado Job Execution detail tab?

- A. The detail tab provides you with the list of job steps that was triggered as a part of the Job Template.
- B. On the detail tab, you will find a checkbox named Restart Execution. This will rerun all the job steps.
- C. Under the detail tab, you can find Job Template execution results such as Status and error messages if the execution failed.
- D. The detail tab contains information about your Job Templates such as job execution type, API name, and description.

Answer: C

Explanation:

Comprehensive and Detailed 100to 150 words of Explanation From Copado Extension builder topics:

The Job Execution detail tab provides information about the result of a Job Template execution. Option D is correct because this tab includes execution-related details such as status and error messages when the execution fails. This information helps administrators and release teams troubleshoot failed automations and understand what happened during a specific run. Job Templates define reusable automation, but Job Execution records represent actual executions of those templates. Option A incorrectly focuses on template- level details such as API name and description. Option B is inaccurate because the detail tab is not mainly described by a Restart Execution checkbox. Option C refers more to the steps involved in execution, but the question asks specifically about the detail tab. Therefore, execution results and failure details are the correct focus.

NEW QUESTION # 25

What is the use of Copado Functions Callback?

- A. Copado Functions Callback is a feature that provides a set of pre-built function scripts.
- B. Copado Functions Callback is a feature that defines the maximum timeout period for the Functions image.
- C. Copado Functions Callback allows you to update the status of the function execution in real-time, triggered via Apex class or flow.
- D. Copado Functions Callback is a user permission set required to create and work with Functions in Copado.

Answer: C

Explanation:

Comprehensive and Detailed 100to 150 words of Explanation From Copado Extension builder topics:

Copado Functions Callback is used to update the status of a function execution in real time when the function is triggered through Apex or Salesforce Flow. This is important because functions can run outside the immediate Salesforce transaction, and Copado still needs a way to receive execution status, progress, and completion details. A callback mechanism helps connect the external or asynchronous function execution back to the Copado record that initiated it. Option C is correct because it describes this real-time update behavior. Option A is incorrect because callbacks are not pre-built scripts. Option B is incorrect because a callback is not a permission set. Option D is also incorrect because timeout settings and Function Images are separate configuration concepts from callback behavior.

NEW QUESTION # 26

When you click create extension button, Copado generates a JSON file with the selected records that you can include in your package afterward.

- A. True
- B. False

Answer: A

Explanation:

Comprehensive and Detailed 100to 150 words of Explanation From Copado Extension builder topics:

The statement is true. When using the Copado Extensions tool, selecting the Create Extension button generates a JSON file containing the selected supported records. This JSON file is important because Copado Function and Job Template records are data records, and data records cannot be packaged directly like standard Salesforce metadata. The generated JSON becomes the transportable representation of those records.

It can then be included in the package structure, commonly through a static resource and related custom metadata configuration.

After the extension is installed in another Copado org, the packaged data can be used to generate the corresponding Function or Job Template records. This process allows Copado automation assets to be reused and distributed through managed or unlocked packages.

NEW QUESTION # 27

Which of the following types of DevOps records can be generated using Copado Extensions tool functionality?(Select all that apply)

- A. Lead source
- B. Apex Class
- C. Copado Job Templates
- D. Copado Functions

Answer: C,D

Explanation:

Comprehensive and Detailed 100to 150 words of Explanation From Copado Extension builder topics:

The Copado Extensions tool can generate extension records for Copado Functions and Copado Job Templates. Options A and D are correct because these are supported Copado DevOps records that can be converted into an extension format. Functions contain script-based automation logic, while Job Templates define reusable execution processes made of Job Steps. Since these are Copado data records, the extension tool helps package them by generating the required JSON representation. Apex Class is not correct in this context because Apex classes are Salesforce metadata and are handled through standard metadata packaging or deployment, not generated as Copado extension records. Lead source is also unrelated because it is a business data value, not a Copado DevOps extension record.

NEW QUESTION # 28

Identify the correct statement regarding Job Engine from the given options.(Select all that apply)

- A. Job Engine is a Copado feature that recalculates the execution logs and prepares a result dashboard to keep track of Job Templates executed as a part of a project.
- B. Job Engine enables functions and flows to access details of different contexts using dynamic expressions.
- C. Job Engine allows you to re-start a failed job execution or begin from the last failed step.
- D. Every time you execute a Job Engine, a Job Execution record is created and associated with the corresponding Job Template.

Answer: B,C

Explanation:

Comprehensive and Detailed 100to 150 words of Explanation From Copado Extension builder topics:

Copado Job Engine is used to run reusable automation through Job Templates and Job Steps. A key capability is that failed executions can be restarted, either by running the whole execution again or by executing only outstanding or failed steps, depending on the execution scenario. This makes option A correct because it reflects recovery behavior during failed automation. Option B is also correct because Job Engine works with Functions and Salesforce Flows, and Dynamic Expressions allow those steps to access contextual values during execution. Option C is inaccurate because the usual execution unit is a Job Template, not "executing a Job Engine." Option D is incorrect because Job Engine is not simply a dashboard or recalculation feature.

NEW QUESTION # 29

.....

As we all know, if we want to pass a exam succesfully, preparation is necessity, especially for the Copado-Extension-BUILDER exam. Our product will help you to improve your efficeince for the preparation of the Copado-Extension-BUILDER exam with list the knowledge points of the exam. And this will help the candicates to handle the the basic knowledge, so that you can pass the Copado-Extension-BUILDER Exam more easily, and the practice materials is fee update for onf year, and money back gyarantee. Possession of the practice materials of our company, it means that you are not worry about the Copado-Extension-BUILDER exam, since the experts of experienced knowledge are guiding you. So just take action now.
