BCS ISTQB Certified Tester Foundation Level CTFL 4.0 Sample Questions (Q69-Q74):

NEW QUESTION # 69

An alphanumeric password must be between 4 and 7 characters long and must contain at least one numeric character, one capital (uppercase) letter and one lowercase letter of the alphabet.

Which one of the following sets of test cases represents the correct outcome of a two-value boundary value analysis applied to the password length? (Note: test cases are separated by a semicolon)

- A. 1RhT;rSp53;3N3e10;8sBdby
- B. 1xA;aB11;Pq1ZZab;7iDD0a1x
- C. aB11;99rSp;5NnN10;7iDD0a1x
- D. 1xB: aB11: 99rSp: 5NnN10; 4NnN10T; 44ghWn19

Answer: A

Explanation:

The correct outcome of a two-value boundary value analysis applied to the password length is the set of test cases represented by option D. Boundary value analysis is a test design technique that focuses on the values at the boundaries of an equivalence partition, such as the minimum and maximum values, or the values just above and below the boundaries. A two-value boundary value analysis uses two values for each boundary, one representing the valid value and one representing the invalid value. For example, if the valid range of values is from 4 to 7, then the two values for the lower boundary are 3 and 4, and the two values for the upper boundary are 7 and 8. The test cases in option D use these values for the password length, while also satisfying the other requirements of the password, such as containing at least one numeric character, one capital letter, and one lowercase letter. The test cases in option D are:

1RhT: a 4-character password that is valid

rSp53: a 5-character password that is valid

3N3e10: a 6-character password that is valid

8sBdby: an 8-character password that is invalid The test cases in the other options are incorrect, because they either use values that are not at the boundaries of the password length, or they do not meet the other requirements of the password. For example, the test cases in option A are:

1xA: a 3-character password that is invalid, but it does not contain a capital letter aB11: a 4-character password that is valid

Pq1ZZab: a 7-character password that is valid

7iDD0a1x: an 8-character password that is invalid Reference: ISTQB Certified Tester Foundation Level (CTFL) v4.0 sources and documents:

NEW QUESTION # 70

Which review type, also known as a "buddy check", is commonly used in Agile development?

- A. Walkthrough.
- B. Informal review.
- C. Inspection.
- D. Technical review.

Answer: B

Explanation:

In Agile development, an informal review, often referred to as a "buddy check," is a common review type. Informal reviews are unstructured and involve a pair of colleagues reviewing each other's work to identify defects early and provide immediate feedback. This type of review is less formal than inspections or walkthroughs and is particularly suitable for Agile environments where rapid feedback and flexibility are essential.

NEW QUESTION # 71

Which of the following statements is NOT true about Configuration management and software testing?

- A. Version controlled test ware increases the chances of finding defects in the software under test.
- B. Configuration management helps maintain consistent versions of software artifacts.
- C. Configuration management supports the build process, which is essential for delivering a test release into the test environment.
- D. When testers report defects, they need to reference version-controlled items.

Answer: A

Explanation:

While configuration management is crucial for maintaining consistent versions of software artifacts and supporting the build process, it does not directly increase the chances of finding defects in the software under test. Version-controlled test ware ensures that the correct versions of test cases and other test artifacts are used, but it is the quality and thoroughness of the tests that determine the effectiveness of defect detection.

NEW QUESTION # 72

For each of the test cases to be executed, the following table specifies the priority order and dependencies on other test cases

Test Case	Priority	Logical Dependencies
TC1	Low	TC5
TC2	High	TC3
TC3	High	TC4
TC4	High	-
TC5	Low	TC2
TC6	Medium	-

Which of the following test execution schedules is compatible with the logical dependencies and allows executing the test cases in priority order?

- A. TC3, TC5, TC6, TC1, TC4, TC3
- B. TC4, TC3, TC2, TC6, TC1, TC5
- C. TC4, TC6, TC3, TC2, TC5, TC1
- D. TC4, TC3, TC2, TC6, TC5, TC1

Answer: B

Explanation:

This answer is correct because it follows the logical dependencies and allows executing the test cases in priority order. TC4, TC3, and TC2 are executed first because they have the highest priority. TC6 is executed next because it has a logical dependency on TC2. TC1 is executed next because it has a logical dependency on TC5. Finally, TC5 is executed last because it has the lowest priority. NEW QUESTION # 73

You are testing the latest version of an air-traffic control system prior to production deployment using exploratory testing. After following an unusual sequence of input steps, the system crashes. After the crash, you document a defect report with the following information:

*Title: System crashes unexpectedly during input.
*Brief summary: System crashes when an unusual sequence of inputs is used.
*Version: V1.001
*Test: Exploratory testing prior to production deployment
*Priority: Urgent
*Risk: High
*References: Screenshot of crashed application
What critical Information Is missing from this report?

- A. Status of defect
- **B. Description of the defect to enable reproduction.**
- C. Change history.
- D. Conclusions, recommendations, and approvals.

Answer: B

Explanation:

The critical information missing from the defect report is a detailed description of the defect to enable reproduction. A clear and concise description of the steps taken to reproduce the defect is essential for developers to understand the context and to be able to replicate the issue in their environment. Without this information, it can be challenging to diagnose and fix the defect. The ISTQB CTFL syllabus emphasizes the importance of providing all necessary details in a defect report to facilitate effective communication and resolution.
