## UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q17-Q22):

### NEW QUESTION # 17

Which of the following best describes a human-in-the-loop automation model?

- A. Users control the robot's every action in real time
- B. Robots only work when manually triggered

- C. Robots run independently without user input
- **D. Unattended robots request user input at certain steps**

**Answer: D**

Explanation:

In a human-in-the-loop automation model, unattended robots perform processes automatically but pause and request user input when required. This model allows robots to handle repetitive and rule-based tasks while humans intervene in scenarios that require decision-making or approval.

UiPath supports human-in-the-loop functionality using tools such as UiPath Action Center, where users can review exceptions, provide additional data, or make business decisions. Once the input is received, the automation resumes and completes the rest of the process autonomously.

This model is particularly useful for processes involving compliance checks, approvals, or document verification - blending the speed of automation with human judgment where necessary.

### NEW QUESTION # 18

In which three stages should user availability be clearly defined and communicated?

- A. Solution Design, Testing, Discovery
- B. Deployment, Hypercare, Project Closure
- C. Business Case Validation, Solution Design, UAT
- **D. Kickoff, Process Analysis, UAT**

**Answer: D**

Explanation:

User availability should be clearly defined and communicated in the Kickoff, Process Analysis, and UAT stages. These stages require direct interaction with Client Team members such as process owners, subject matter experts (SMEs), and end users.

\* During Kickoff, availability is discussed to plan for workshops, document reviews, and approvals.

\* In Process Analysis, SMEs are needed to walk through the As-Is process for accurate documentation.

\* In UAT, end users test the solution to ensure it meets business needs. Their availability is crucial for timely validation and sign-off. Clear communication of availability in these stages helps avoid scheduling conflicts, delays, and incomplete information gathering.

### NEW QUESTION # 19

Which three roles from the Implementation Team participate in the Process Analysis stage?

- A. Automation Developer, Solution Architect, Client SME
- **B. Solution Architect, Project Manager, Business Analyst**
- C. Project Manager, Developer, Client IT
- D. Business Analyst, Infrastructure Engineer, Project Manager

**Answer: B**

Explanation:

During the Process Analysis stage, the following three key roles from the Implementation Team are involved:

\* Solution Architect

\* Project Manager

\* Business Analyst

Each role brings a unique perspective and responsibility to the analysis. The business analyst focuses on understanding the business goals and documenting the As-Is process. The solution architect evaluates the process from a technical standpoint to identify automation opportunities and potential roadblocks. The project manager oversees the planning and timelines to ensure alignment with the broader project goals.

This collaborative analysis results in a comprehensive and well-documented Process Definition Document (PDD), which becomes the foundation for the subsequent design and development phases. This stage is critical to ensuring that the correct processes are chosen for automation and that the team is aligned on the scope and expectations.

### NEW QUESTION # 20

Which of the following best describes how automation software robots operate?

- A. They mimic human actions to interact with digital systems and applications.
- B. They require constant human supervision.
- C. They physically interact with machines to perform tasks.
- D. They write code autonomously.

**Answer: A**

Explanation:

Automation software robots, particularly those built using UiPath, operate by mimicking human actions to interact with digital systems and applications. This includes actions such as clicking buttons, typing into fields, reading data from screens, extracting information from documents, navigating applications, and triggering system events. Their behavior is defined through automation workflows created by developers using tools like UiPath Studio.

These robots do not require constant supervision; unattended robots operate autonomously, while attended robots are triggered by users. They also do not interact physically with machines. Instead, they work entirely within virtual environments, desktops, and applications.

By replicating human behavior in digital workflows, robots can perform repetitive, rule-based tasks consistently, quickly, and without fatigue. This enables organizations to improve operational efficiency, reduce human error, increase accuracy, and free employees to focus on more strategic work.

Software robots do not write code on their own; developers design their workflows. However, with AI enhancements, they can assist in automation development. Still, their core functionality relies on executing predefined instructions that simulate human interaction with digital systems.

#### NEW QUESTION # 21

Which of the following is NOT a typical component of As-Is process documentation?

- A. Future automation benefits
- B. Input/output data
- C. Process exceptions and variations
- D. System interactions

**Answer: A**

Explanation:

Future automation benefits are not typically included in the As-Is process documentation. The purpose of As-Is documentation, typically part of the Process Definition Document (PDD), is to describe the current, manual state of the process in exhaustive detail. Components of As-Is documentation usually include:

- \* Step-by-step process activities
- \* Process exceptions and variations
- \* Inputs and outputs
- \* Application or system interactions
- \* Time and resource estimates
- \* Roles involved in the process

While future automation benefits are essential for business case justification, they are discussed during the Business Case and Technical Validation stage, not as part of documenting the As-Is state. Including future benefits in the As-Is documentation could lead to confusion, as the purpose is to objectively represent the current state, which forms the basis for defining the To-Be (automated) state in later stages.
