WGU Operations Management (C215, VDC2) Sample Questions (Q60-Q65):

NEW QUESTION # 60

Why is kanban significant to the "pull" system?

- A. It is a process that is only for support or maintenance.
- B. It is a process that highlights the highest-performing organization.
- C. It requires that all work items are sized the same.
- D. It specifies the exact quantity of a product that needs to be produced.

Answer: D

Explanation:

Kanban is significant to the pull system because it specifies the exact quantity of a product that needs to be produced.

In a pull system, production is triggered by actual demand, not forecasts. Kanban cards or signals authorize the movement or production of a specific quantity only when downstream processes require it.

Kanban supports:

- * Inventory reduction
- * Flow synchronization
- * Waste elimination
- * Visual control

Each kanban represents permission to produce or move a defined quantity, preventing overproduction—one of the most costly forms of waste.

The other options are incorrect:

- * Work items do not need to be identical
- * Kanban applies to core production, not just support
- * It does not rank organizations

Kanban is a cornerstone of JIT and lean systems because it operationalizes the pull principle in a simple, visual, and disciplined way.

NEW QUESTION # 61

Which two factors affect a service location decision? Choose 2 answers

- A. Quality-of-life issues
- B. Closeness to manufacturing facilities
- C. Warehouse storage
- D. Proximity to customers

Answer: A,D

Explanation:

For service organizations, proximity to customers and quality-of-life issues are two dominant factors in location decisions.

Unlike manufacturing, service operations require direct customer contact. Being close to customers reduces travel time, improves convenience, enhances responsiveness, and increases perceived service quality.

Examples include hospitals, banks, restaurants, and consulting offices, where location accessibility directly influences demand.

Quality-of-life issues—such as education, healthcare, housing, safety, climate, and cultural amenities—affect the ability to attract and retain skilled service employees. Human capital is a critical input in service operations, and workforce availability often outweighs cost considerations.

The other options are less relevant:

- * Manufacturing proximity matters mainly for production facilities
- * Warehouse storage is a logistics concern, not a service driver

Operations Management emphasizes that service location decisions balance customer access and employee satisfaction, since both directly influence service quality, productivity, and long-term sustainability.

NEW QUESTION # 62

A manufacturing firm uses warehouses and shippers in their supply chain.

At which stage of the firm's inventory management system would the statement "percentage of line items shipped on schedule" be used?

- A. Work-in-progress
- B. Sold goods
- C. Raw materials
- D. Finished goods

Answer: D

Explanation:

The performance measure "percentage of line items shipped on schedule" applies to finished goods inventory.

Finished goods inventory represents completed products ready for shipment to customers. On-time shipment is a critical service-level indicator at this stage because it directly affects:

- * Customer satisfaction
- * Order fulfillment performance

* Distribution efficiency

Work-in-progress and raw materials inventories are internal to production and do not involve customer shipment commitments.

"Sold goods" is not an inventory classification used in Operations Management.

Supply chain metrics for finished goods typically include:

* On-time delivery rate

* Order accuracy

* Fill rate

* Shipment reliability

By tracking shipment performance at the finished goods stage, firms ensure that downstream distribution aligns with customer expectations and supply chain objectives.

NEW QUESTION # 63

Which two statements are true about effective capacity?

Choose 2 answers

- A. An effective capacity maintains a minimum output rate under normal conditions.
- B. An effective capacity is a permanent measure used to achieve design capacity.
- C. An effective capacity is a temporary measure used to achieve design capacity.
- D. An effective capacity is lower than design capacity.

Answer: B,D

Explanation:

Effective capacity represents the maximum output a system can realistically achieve under normal operating conditions. It is always slower than design capacity, which assumes ideal, uninterrupted conditions.

Statement A is correct because effective capacity accounts for:

* Scheduled maintenance

* Breaks and shift changes

* Setup times

* Normal inefficiencies

Statement B is also correct because effective capacity is considered a stable, ongoing measure used for operational planning and performance evaluation. It reflects how a system is designed to operate sustainably over time, not temporarily.

Statement C is incorrect because effective capacity is not a short-term or temporary measure; it is used consistently for planning, scheduling, and forecasting.

Statement D is incorrect because effective capacity does not define a minimum output level—it defines a realistic maximum under expected conditions.

In Operations Management, effective capacity is essential for:

* Capacity utilization calculations

* Aggregate planning

* Location and facility decisions

* Bottleneck analysis

By distinguishing between design and effective capacity, managers avoid unrealistic expectations and plan resources more accurately, reducing congestion, overtime, and quality problems.

NEW QUESTION # 64

The annual cost of goods sold for a company is \$8,400,000 and the average inventory is \$1,200,000.

What is the number of weeks of supply?

- A. 0
- B. 1
- C. 2
- D. 3
- E. 4

Answer: C

Explanation:

Weeks of supply measures how long inventory will last based on average usage. It is calculated using the formula:

Weeks of Supply = (Average Inventory / Annual Cost of Goods Sold) × 52

Substituting the given values:

Weeks of Supply = $(1,200,000 / 8,400,000) \times 52$

Weeks of Supply = 0.142857×52

Weeks of Supply #7.43 weeks

When rounded to the nearest whole number, the answer is 7 weeks.

In Operations and Supply Chain Management, weeks of supply is a key inventory performance metric because it:

- * Indicates inventory efficiency
- * Helps balance service levels and holding costs
- * Supports cash flow management
- * Enables comparison across products or firms

Too many weeks of supply signal excess inventory and high holding costs, while too few weeks increase the risk of stockouts and service failures.

Managers use this metric alongside inventory turnover to evaluate how effectively inventory supports demand while minimizing waste.
