Lead2Passed ensure that the first time you take the exam will be able to pass the exam to obtain the exam certification. Because Lead2Passed can provide to you the highest quality analog Juniper JN0-281 Exam will take you into the exam step by step. Lead2Passed guarantee that Juniper JN0-281 exam questions and answers can help you to pass the exam successfully.

Juniper Data Center, Associate (JNCIA-DC) Sample Questions (Q147-Q152):

NEW QUESTION # 147

What is the primary role of an IRB interface in a VLAN configuration?

- A. To provide a gateway for VLAN traffic.

- B. To filter VLAN traffic based on MAC addresses.
- C. To encrypt VLAN traffic.
- D. To prioritize VLAN traffic.

Answer: A

NEW QUESTION # 148

In a traditional multi-tier architecture, which layer is responsible for aggregating access layers and providing connectivity to the core layer?

- A. Core Layer
- B. Access Layer
- C. Distribution Layer
- D. Edge Layer

Answer: C

NEW QUESTION # 149

What are two consequences of having all network devices in a single collision domain? (Choose two.)

- A. The chance of packet collision is increased.
- B. The chance of packet collision is decreased.
- C. The amount of network resource consumption is increased.
- D. The amount of network resource consumption does not change.

Answer: A,C

Explanation:

A collision domain is a network segment where data packets can "collide" with one another when being sent on the same network medium.

Step-by-Step Breakdown:

Increased Collision Probability:

If all devices are in a single collision domain, the likelihood of packet collisions increases as more devices attempt to send packets simultaneously, leading to network inefficiencies.

Increased Resource Consumption:

More collisions result in increased network resource consumption as devices need to retransmit packets, causing higher utilization of bandwidth and slowing down network performance.

Juniper Reference:

Collision Domains: Proper network segmentation using switches reduces collision domains, thereby improving network performance and reducing packet collisions.

NEW QUESTION # 150

When considering bidirectional forwarding detection, which two statements are correct? (Choose two.)

- A. The BFD operation always consists of minimum intervals and multipliers.
- B. The BFD default minimum interval is 3.
- C. The BFD default multiplier is 5.
- D. You can configure BFD per interface within the protocol stanza.

Answer: A,D

Explanation:

Bidirectional Forwarding Detection (BFD) is a protocol used to detect faults in the forwarding path between two routers. It provides rapid failure detection, enhancing the performance of routing protocols like OSPF, BGP, and IS-IS.

Step-by-Step Breakdown:

Per Interface Configuration:

BFD can be configured on a per-interface basis within the protocol stanza (e.g., OSPF, BGP). This allows granular control over where BFD is enabled and the failure detection intervals for specific interfaces.

Minimum Interval and Multiplier:

BFD uses a minimum interval (the time between BFD control packets) and a multiplier (the number of missed packets before the path is declared down). The combination of these two defines the detection time for failures.

Juniper Reference:

BFD Configuration: In Juniper, BFD is configurable within routing protocol stanzas, with the failure detection mechanism always based on minimum intervals and multipliers.

NEW QUESTION # 151

What is the purpose of using route reflectors in BGP?

- A. To automatically select the best route
- B. To increase the speed of BGP convergence
- C. To reduce the number of required IBGP sessions in a network
- D. To encrypt BGP messages

Answer: C

NEW QUESTION # 152
