# Understanding functional and technical aspects of Design Resilient Architectures

The following will be discussed in the **AMAZON AWS-Solutions-Architect-Associate exam dumps**:

- Select high-performing and scalable storage solutions for a workload
- Design secure application tiers
- Select appropriate data security options
- Design secure access to AWS resources
- Identify elastic and scalable compute solutions for a workload

The following should be prepared in advance:

- **Cost Optimization:** The ability to run systems to deliver business value at the lowest price point.
- **Reliability:** The reliability pillar encompasses the ability of a workload to perform its intended function correctly and consistently when it's expected to. This includes the ability to operate and test the workload through its total lifecycle. This paper provides in-depth, best practice guidance for implementing reliable workloads on AWS.
- **Operational Excellence:** The ability to support development and run workloads effectively, gain insight into their operations, and to continuously improve supporting processes and procedures to deliver business value.
- **Security:** The security pillar encompasses the ability to protect data, systems, and assets to take advantage of cloud technologies to improve your security.
- **Performance Efficiency:** The ability to use computing resources efficiently to meet system requirements, and to maintain that efficiency as demand changes and technologies evolve.

## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q112-Q117):

### NEW QUESTION # 112

A global media streaming company is migrating its user authentication and content delivery services to AWS.

The company wants to use Amazon API Gateway for user authentication and authorization. The company needs a solution that restricts API access to AWS Regions in the United States and ensures minimal latency.

Which solution will meet these requirements?

- A. Create an API Gateway HTTP API. Configure an AWS WAF firewall in the same Region. Implement AWS WAF rules to deny requests that originate from Regions outside the United States. Associate the AWS WAF firewall with the API Gateway HTTP API.
- B. Create an API Gateway REST API. Configure an AWS WAF firewall in a different Region. Implement AWS WAF rules to deny requests that originate from Regions outside the United States. Associate the AWS WAF firewall with the API Gateway REST API.
- C. Create an API Gateway HTTP API. Configure an AWS WAF firewall in a different Region. Implement AWS WAF rules to deny requests that originate from Regions outside the United States. Associate the AWS WAF firewall with the API Gateway HTTP API.
- **D. Create an API Gateway REST API. Configure an AWS WAF firewall in the same Region. Implement AWS WAF rules to deny requests that originate from Regions outside the United States. Associate the AWS WAF firewall with the API Gateway REST API.**

**Answer: D**

Explanation:

AWS documentation states that for API Gateway REST APIs, AWS WAF must be deployed in the same Region to apply web access control lists. WAF geographic match rules can block requests from non-US Regions. Deploying the WAF and API Gateway in the same Region ensures minimal latency because the traffic does not traverse Regions.

Options B and C violate the requirement that WAF and API Gateway must be in the same Region. Option D uses HTTP API, which supports WAF only indirectly via regional ALBs, not directly as REST API does.

### NEW QUESTION # 113

A company is running an SMB file server in its data center. The file server stores large files that are accessed frequently for the first few days after the files are created. After 7 days the files are rarely accessed.

The total data size is increasing and is close to the company's total storage capacity. A solutions architect must increase the company's available storage space without losing low-latency access to the most recently accessed files. The solutions architect must also provide file lifecycle management to avoid future storage issues.

Which solution will meet these requirements?

- A. Install a utility on each user's computer to access Amazon S3. Create an S3 Lifecycle policy to transition the data to S3 Glacier Flexible Retrieval after 7 days.
- B. Create an Amazon FSx for Windows File Server file system to extend the company's storage space.
- C. Use AWS DataSync to copy data that is older than 7 days from the SMB file server to AWS.
- **D. Create an Amazon S3 File Gateway to extend the company's storage space. Create an S3 Lifecycle policy to transition the data to S3 Glacier Deep Archive after 7 days.**

**Answer: D**

Explanation:

Amazon S3 File Gateway is a hybrid cloud storage service that enables on-premises applications to seamlessly use Amazon S3 cloud storage. It provides a file interface to Amazon S3 and supports SMB and NFS protocols.

It also supports S3 Lifecycle policies that can automatically transition data from S3 Standard to S3 Glacier Deep Archive after a specified period of time. This solution will meet the requirements of increasing the company's available storage space without losing low-latency access to the most recently accessed files and providing file lifecycle management to avoid future storage issues.

### NEW QUESTION # 114

A developer has a script to generate daily reports that users previous. The script consistently complete in under 10 minutes. The developer needs to automate the process in a cost effective manner.

Which combination of services should the developer use? (Select two)

- A. Amazon EC2 On-Demand instance with user data
- B. Amazon EventBridge (Amazon CloudWatch Event)
- **C. AWS Lambda**
- **D. AWS CloudTrail**
- E. Cron on an Amazon EC2 instance

**Answer: C,D**

### NEW QUESTION # 115

A company is deploying a new public web application to AWS. The application will run behind an Application Load Balancer (ALB). The application needs to be encrypted at the edge with an SSL/TLS certificate that is issued by an external certificate authority (CA). The certificate must be rotated each year before the certificate expires.

What should a solutions architect do to meet these requirements?

- A. Use AWS Certificate Manager (ACM) to issue an SSL/TLS certificate. Apply the certificate to the ALB. Use the managed renewal feature to automatically rotate the certificate.
- B. Use AWS Certificate Manager (ACM) Private Certificate Authority to issue an SSL/TLS certificate from the root CA. Apply the certificate to the ALB. Use the managed renewal feature to automatically rotate the certificate.
- C. Use AWS Certificate Manager (ACM) to issue an SSL/TLS certificate. Import the key material from the certificate. Apply the certificate to the ALB. Use the managed renewal feature to automatically rotate the certificate.

- D. Use AWS Certificate Manager (ACM) to import an SSL/TLS certificate. Apply the certificate to the ALB. Use Amazon EventBridge (Amazon CloudWatch Events) to send a notification when the certificate is nearing expiration. Rotate the certificate manually.

**Answer: D**

#### NEW QUESTION # 116

A company runs a stateless web application in production on a group of Amazon EC2 On-Demand Instances behind an Application Load Balancer. The application experiences heavy usage during an 8-hour period each business day. Application usage is moderate and steady overnight. Application usage is low during weekends.

The company wants to minimize its EC2 costs without affecting the availability of the application.

Which solution will meet these requirements?

- A. Use Reserved instances for the baseline level of usage. Use Spot Instances for any additional capacity that the application needs.
- B. Use Spot Instances for the entire workload.
- C. Use On-Demand Instances for the baseline level of usage. Use Spot Instances for any additional capacity that the application needs.
- D. Use Dedicated Instances for the baseline level of usage. Use On-Demand Instances for any additional capacity that the application needs.

**Answer: A**

Explanation:

Explanation

Reserved is cheaper than on demand the company has. And it's meet the availability (HA) requirement as to spot instance that can be disrupted at any time. PRICING BELOW. On-Demand: 0% There's no commitment from you. You pay the most with this option.

Reserved : 40%-60% 1-year or 3-year commitment from you.

You save money from that commitment. Spot 50%-90% Ridiculously inexpensive because there's no commitment from the AWS side.
