## Validate Your Skills with Nutanix NCP-MCA Exam Questions

Checking our NCP-MCA free demo is a great way of learning the pattern of exam materials and if it suits what you wanted. There are valid NCP-MCA test questions and accurate answers along with the professional explanations in our study guide. All real questions just need to practice one or two days and remember the answers will save you much time in NCP-MCA Real Exam. Come and join us.

## Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q69-Q74):

### NEW QUESTION # 69

Which Nutanix product version must be compatible to deploy Self-service (formerly Calm)?

- A. Prism Central
- B. AOS
- C. Prism Element
- D. AHV

**Answer: A**

Explanation:

To deploy Self-Service (formerly Calm), the Nutanix product version that must be compatible is Prism Central. Self-Service relies on Prism Central for orchestration, management, and automation of applications and services across multiple environments.

References:

- \* Nutanix documentation on Self-Service (Calm) Requirements.
- \* Nutanix Best Practices for Deploying Self-Service.

### NEW QUESTION # 70

What is the correct method to upgrade Calm?

- A. Calm Marketplace
- B. LCM via Prism Element
- C. LCM via Prism Central
- D. Calm Dashboard

**Answer: C**

Explanation:

You can upgrade Nutanix Calm or Epsilon (the orchestration engine used by Nutanix Calm) by using the Life Cycle Manager (LCM) from the Prism Central. LCM allows you to upgrade Calm or Epsilon independently or simultaneously. You can also select the version that you want to upgrade to and perform the update from the Options list. For more information, see the Nutanix Calm Upgrades section in the Nutanix Calm Admin and Operations Guide<sup>1</sup> and the Performing Inventory and Upgrading Calm with Life Cycle Manager article<sup>2</sup>. ### NEW QUESTION # 71

□ A company has the following departments:

HR

Accounting

Support

Sales

e-commerce

An administrator has created a Playbook that will add memory to the affected VMS when the configured alert is triggered.

Which VMS will get more memory?

- A. Production VMS from Support and eCommerce
- B. All the VMS categorized as Production.
- C. Production VMS from the eCommerce department
- D. All the VMS from Sales

**Answer: A**

### NEW QUESTION # 72

Refer to the exhibit.

□ An administrator has finished developing a blueprint to deploy a Kubernetes cluster, but is receiving warnings after saving the blueprint.

In which two ways should the administrator resolve the warnings that are being presented? (choose two.)

- A. Create the variable under the action.
- B. Create an add\_work\_node\_count variable.
- C. Create a remove\_work\_node\_name variable.
- D. Delete the variable under action.

**Answer: A,B**

Explanation:

The warnings in the exhibit indicate that certain variables are missing or incorrectly defined. To resolve these warnings, the administrator should:

Create the variable under the action: Ensure that the necessary variables are defined in the scope of the action where they are required.

Create an `add_worker_node_count` variable: Specifically, the blueprint requires a variable named `add_worker_node_count`. This variable should be defined and given an appropriate value to ensure the action can execute properly.

Nutanix Calm documentation on Blueprint Variables.

Nutanix Best Practices for Blueprint Development.

### NEW QUESTION # 73

Refer to the exhibit.

An administrator created the Playbook shown in the exhibit to allow for manual reduction of vCPU count on any selected VM within their environment. During a test run of the play on one of the VMs running in development, the administrator ran into an error that the Playbook cannot be completed against the selected VM.

Here are the details of the affected VM:

VM Name: VM2

vCPU: 4

RAM: 8 GB

OS: Windows 2016

Hypervisor: AHV

What caused this Playbook to fail?

- A. The VM needs to be powered off before vCPU can be reduced.
- **B. Reduction of vCPU cannot be done on a VM with a running snapshot.**
- C. This play cannot be executed against a VM on AHV.
- D. The play will cause the VM to go below the minimum vCPU.

**Answer: B**

Explanation:

The Playbook is designed to manually reduce the vCPU count on any selected VM within the environment.

However, it failed during a test run on VM2 because there was a running snapshot of the VM. According to Nutanix Multicloud Automation (NCP-MCA) principles, you cannot reduce the vCPU count on a VM that has an active snapshot<sup>1</sup>. This is because the snapshot captures the state of the VM configuration and data, and reverting to a snapshot will restore both the guest OS and the virtual hardware<sup>2</sup>. Therefore, changing the vCPU count while a snapshot is running will cause inconsistency and error. The other options are incorrect because:

\* A. The Playbook can be executed against a VM on AHV, as long as there is no snapshot running<sup>3</sup>.

\* B. The VM does not need to be powered off before vCPU can be reduced, as this can be done using hot-plug CPU feature<sup>4</sup>.

\* D. The play will not cause the VM to go below the minimum vCPU, as the minimum number of vCPUs is set to 1 in the Playbook, and the VM has 4 vCPUs initially. References: Nutanix Support & Insights, Solved: Snapshot query !! - VMware Technology
