By using our Analytics-Arch-201 exam braindumps, it will be your habitual act to learn something with efficiency. With the cumulative effort over the past years, our Analytics-Arch-201 study guide has made great progress with passing rate up to 98 to 100 percent among the market. A lot of professional experts concentrate to making our Analytics-Arch-201 Preparation materials by compiling the content so they have gained reputation in the market for their proficiency and dedication.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.

Topic 2	<ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.
Topic 3	<ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.

100% Pass Salesforce - Analytics-Arch-201 - Newest Salesforce Certified Tableau Architect Vce Torrent

Many don't find real Analytics-Arch-201 exam questions and face loss of money and time. PracticeMaterial made an absolute gem of study material which carries actual Salesforce Analytics-Arch-201 Exam Questions for the students so that they don't get confused in order to prepare for Salesforce Analytics-Arch-201 Exam and pass it with a good score. The Salesforce Analytics-Arch-201 practice test questions are made by examination after consulting with a lot of professionals and receiving positive feedback from them.

Salesforce Certified Tableau Architect Sample Questions (Q75-Q80):

NEW QUESTION # 75

For an administrative dashboard designed to monitor overall Tableau Server health, which key metric should be prominently featured?

- A. The frequency of user logins and logouts on the server
- B. The total number of views created by users each day
- C. The number of extract refresh failures occurring on the server
- **D. The average load time of dashboards and views on the server**

Answer: D

Explanation:

The average load time of dashboards and views on the server In an administrative dashboard focusing on Tableau Server health, featuring the average load time of dashboards and views is crucial. This metric provides a direct indication of server performance and user experience. It helps identify if there are any speed or efficiency issues that need to be addressed to maintain optimal server health. Option A is incorrect because the total number of views created does not directly indicate server health. Option C is incorrect as the frequency of user logins and logouts, while important, doesn't directly reflect the server's performance. Option D is incorrect because while extract refresh failures are important, they do not provide a comprehensive overview of server health like average load times do.

NEW QUESTION # 76

When recommending an automated deployment method for Tableau Server updates, which approach is most effective in ensuring minimal disruption and consistent application across a large organization?

- A. Relying on manual installation by each server administrator to ensure individual control

- B. Setting up an internal website where administrators can download updates at their convenience
- C. Employing email notifications to prompt administrators to download and install updates individually
- D. Using a network management tool like Microsoft SCCM to automate and standardize the deployment of updates

Answer: D

Explanation:

Using a network management tool like Microsoft SCCM to automate and standardize the deployment of updates Utilizing a network management tool such as Microsoft System Center Configuration Manager (SCCM) is the most effective approach for automating and standardizing Tableau Server updates in a large organization. This method ensures that updates are applied consistently across all servers, reduces the risk of human error, and minimizes disruption to operations. Option A is incorrect because manual installation by each server administrator is time-consuming and prone to inconsistency. Option C is incorrect as email notifications rely on manual action by administrators, which can lead to delays and inconsistency in updates. Option D is incorrect because setting up an internal website for downloading updates does not ensure timely or standardized application across the organization.

NEW QUESTION # 77

In implementing Tableau Bridge for an organization using Tableau Cloud, what is an important consideration for maintaining data security and integrity?

- A. Configuring Tableau Bridge with appropriate authentication and encryption for secure data transmission
- B. Using Tableau Bridge to store a copy of all on-premises data on the cloud for backup purposes
- C. Limiting Tableau Bridge access to only a few select high-level administrators for security reasons
- D. Completely isolating Tableau Bridge from the internal network to prevent any potential security breaches

Answer: A

Explanation:

Configuring Tableau Bridge with appropriate authentication and encryption for secure data transmission When implementing Tableau Bridge, it's important to configure it with proper authentication and encryption measures. This ensures secure transmission of data from on-premises sources to Tableau Cloud, maintaining data security and integrity without exposing sensitive information. Option A is incorrect because Tableau Bridge does not store copies of data on the cloud; it facilitates live data connections. Option B is incorrect as limiting access to only a few administrators can hinder operational flexibility and is not necessary for maintaining security. Option D is incorrect because completely isolating Tableau Bridge from the internal network can render it ineffective in connecting on-premises data to Tableau Cloud.

NEW QUESTION # 78

During the troubleshooting of SAML authentication issues in Tableau Server, what is a common area to investigate?

- A. The storage capacity of the Tableau Server to handle SAML requests
- B. The time synchronization between Tableau Server and the SAML identity provider
- C. The network bandwidth and latency between the Tableau Server and the SAML provider
- D. The version compatibility of the web browser used to access Tableau Server

Answer: B

Explanation:

The time synchronization between Tableau Server and the SAML identity provider Ensuring time synchronization between Tableau Server and the SAML identity provider is a common and crucial aspect to check when troubleshooting SAML authentication issues. SAML assertions often have time constraints, and discrepancies in system times can lead to failed authentications. Option A is incorrect because network bandwidth and latency, while important for overall performance, are less likely to be the cause of SAML-specific issues. Option C is incorrect as storage capacity of the Tableau Server is generally not related to handling SAML authentication requests. Option D is incorrect because version compatibility of the web browser, while important for user experience, is not a common cause of SAML authentication problems.

NEW QUESTION # 79

In setting up a test environment for load testing Tableau Server, what consideration is important to ensure that test results are meaningful and applicable to real-world scenarios?

- A. Testing only during off-peak hours to ensure that the server is not under any undue stress
- B. Isolating the test environment completely from the production network to avoid any potential interference
- C. Including a variety of dashboards and data sources that reflect the actual usage patterns seen in the production environment
- D. Limiting the test environment to older hardware to assess performance on the minimum required specifications

Answer: C

Explanation:

Including a variety of dashboards and data sources that reflect the actual usage patterns seen in the production environment For the test results to be meaningful and applicable, it is important to include a variety of dashboards and data sources in the test environment that closely mimic the actual usage patterns of the production environment. This approach ensures that the load testing covers a range of scenarios and provides insights that are relevant to the real-world operation of the Tableau Server. Option A is incorrect because using older hardware might not accurately represent the current production environment and could provide skewed results. Option C is incorrect as completely isolating the test environment may not be practical and can omit important interactions that could impact performance. Option D is incorrect because testing should simulate a variety of conditions, including peak usage times, to fully understand the server's capabilities.

NEW QUESTION # 80

.....

As candidates, the quality must be your first consideration when buying Analytics-Arch-201 learning materials. We have a professional team to collect the first-hand information for the exam. Our company have reliable channel for collecting Analytics-Arch-201 learning materials. We can ensure you that Analytics-Arch-201 exam materials you receive are the latest version. We have strict requirements for the Analytics-Arch-201 Questions and answers, and the correctness of the answers can be guaranteed. In order to serve our customers better, we offer free update for you, so that you can get the latest version timely.
