## CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q261-Q266):

### NEW QUESTION # 261

For which of the following reasons is the infrastructure as code technique used?

- A. To improve the ability to migrate applications to different cloud providers to avoid vendor lock-in.
- B. To specify the hardware configuration and system installation procedures in machine-readable formats.
- C. To capture the system configurations to track changes and remediate configuration drift.
- D. To assign server administration responsibilities to software developers for application deployments.

**Answer: C**

Explanation:

Infrastructure as code (IaC) is a software engineering approach that allows the provisioning and management of infrastructure resources using code and automation<sup>1</sup>. It involves defining infrastructure configurations and provisioning them through code, rather than manually configuring and managing infrastructure resources<sup>2</sup>. One of the main reasons for using IaC is to capture the system configurations to track changes and remediate configuration drift<sup>3</sup>. Configuration drift is the phenomenon where the actual state of an infrastructure resource deviates from its desired state over time due to manual interventions, updates, patches, or other factors. Configuration drift can cause inconsistencies, errors, and security issues in the infrastructure environment. IaC helps to prevent and detect configuration drift by storing the infrastructure configuration code in a version control system and applying it consistently across all environments. IaC also enables the use of automated testing and validation tools to verify the compliance and functionality of the infrastructure resources. By using IaC, DevOps teams can ensure that the infrastructure is always in a known and reproducible state, and that any changes are documented and traceable. **NEW QUESTION # 262**

A development team just deployed a new code release to the staging environment. Change management procedures dictate that all new code must be checked for vulnerabilities prior to release. Which of the following will the security analyst most likely perform prior to the code being deployed to production?

- A. A penetration test
- B. A load test
- C. A malware scan
- D. An application scan

**Answer: D**

Explanation:

An application scan is typically performed to identify vulnerabilities in the code, such as security flaws, bugs, and weaknesses that could be exploited. Since the change management procedure requires checking for vulnerabilities prior to release, this scan will help ensure the code is secure before it is deployed to production. This type of scan looks for issues such as SQL injection, cross-site scripting (XSS), and other common application vulnerabilities.

**NEW QUESTION # 263**

A private cloud is defined as:

- A. a deployment model that uses virtualization technologies to provide infrastructure on demand within its network.
- B. a deployment model that partners with other industry related companies to provide infrastructure services.

- D. a deployment model that uses an external cloud provider to provide host infrastructure services that are Internet accessible.

Which of the following cloud migration methods would take full advantage of the cloud computing model?

- A. Rip and replace
- B. Phased
