## EMC Dell PowerFlex Operate Exam Sample Questions (Q15-Q20):

### NEW QUESTION # 15

Which tasks can be performed using Dynamic Node Addition in PowerFlex? (Choose two).

- A. Configure Protection Domains
- B. Increase compute resources
- C. Enable automatic snapshot creation
- D. Expand storage capacity

**Answer: B,D**

Explanation:

Dynamic Node Addition is the process of scaling out the cluster by adding more physical servers.

\* Expand storage capacity (Option A): When a new node running the SDS (Storage Data Server) service is added, its local drives are added to the Storage Pool. PowerFlex automatically rebalances data to these new drives, increasing the total usable capacity of the cluster.

\* Increase compute resources (Option C): In an HCI (Hyper-Converged Infrastructure) deployment, adding a node adds not just storage, but also CPU and RAM available for running applications or VMs (Compute). Even in a two-layer configuration, adding a compute-only node (SDC) increases compute resources.

### NEW QUESTION # 16

Which prerequisites must be met to enable replication between PowerFlex clusters? (Choose two).

- A. Assign replication roles to volumes
- B. Configure network connectivity between clusters
- C. Define VLAN tagging for replication traffic
- D. Enable snapshot scheduling on both clusters

**Answer: B,C**

Explanation:

PowerFlex native replication allows for asynchronous replication between two geographically distinct clusters.

\* Configure network connectivity (Option A): The source cluster's SDS nodes must be able to route traffic to the destination cluster's SDS nodes (or SDR nodes in older versions). This requires a physical WAN link and proper routing/gateway configurations.

\* Define VLAN tagging for replication traffic (Option D): Replication traffic is heavy and should be isolated from standard management or internal rebuild traffic. Configuring a dedicated VLAN for replication ensures that the replication data stream has sufficient bandwidth and does not congest the local storage network.

#### NEW QUESTION # 17

What type of authentication is supported for managing user accounts in PowerFlex?

- A. TACACS+
- B. RADIUS
- C. LDAP
- D. SAML

**Answer: C**

Explanation:

LDAP (Lightweight Directory Access Protocol) is the primary external authentication method supported by the PowerFlex core (MDM) for managing user access.

\* Integration: PowerFlex can be configured to query an Active Directory or OpenLDAP server. This allows administrators to map AD Groups (e.g., "Storage Admins") to PowerFlex roles (e.g., "SuperUser"), centralizing password management and user termination.

\* Note on SAML: While PowerFlex Manager (the management platform) and newer versions (v4.x) support SAML/OIDC for Single Sign-On, LDAP remains the fundamental answer for core authentication in most exam contexts unless specifically asking about PowerFlex Manager 4.0 Identity Management. TACACS+ and RADIUS are network-centric protocols and are generally not supported by the PowerFlex storage core.

#### NEW QUESTION # 18

What is the benefit of enabling deduplication in PowerFlex storage?

- A. Ensures fault tolerance
- B. Increases node discovery rates
- C. Reduces data redundancy and capacity footprint
- D. Enhances data replication speed

**Answer: C**

Explanation:

Deduplication (often paired with compression) is an efficiency feature available in PowerFlex Fine Granularity (FG) storage pools.

\* Reduces data redundancy (Option A): The primary purpose of inline deduplication is to identify repeated data patterns (blocks) as they are written to the system. Instead of writing the same 4KB block of zeroes or identical OS files multiple times, PowerFlex writes it once and creates pointers for subsequent writes. This significantly reduces the physical storage capacity required to store data, particularly in VDI (Virtual Desktop Infrastructure) or virtualized server environments where many VMs share similar OS files. Note: Deduplication is a trade-off; it saves space but requires more CPU/RAM overhead on the Storage Data Servers (SDS).

#### NEW QUESTION # 19

What are the benefits of using snapshots in PowerFlex? (Choose two).

- A. Reduce fault tolerance across clusters
- B. Enable quick data recovery
- C. Create a point-in-time copy of data
- D. Minimize storage capacity usage

**Answer: B,C**
