Cisco Designing and Implementing Secure Cloud Access for Users and Endpoints Sample Questions (Q133-Q138):

NEW QUESTION # 133

Refer to the exhibit. An engineer must integrate Cisco Cloudlock with Salesforce in an organization. Despite the engineer's successful execution of the Salesforce integration with Cloudlock, the administrator still lacks the necessary visibility. What should be done to meet the requirement?

- A. From Cloudlock, enable the View All Data permission.
- B. From Salesforce, configure the service parameters.
- C. From Salesforce, enable the View All Data permission.
- D. From Cloudlock, configure the service parameters.

Answer: A

Explanation:

After Cloudlock is integrated with Salesforce, full visibility into objects and data requires that Cloudlock has the "View All Data" permission enabled on the connected Salesforce account. This permission allows the Cloudlock API connection to access all user data, regardless of individual field-level or sharing rules. Without it, Cloudlock will be limited in its visibility scope.

As per SCAZT (Section 4: Application and Data Security, Pages 86-89), integration with SaaS platforms like Salesforce must include enabling comprehensive data visibility to perform effective risk analysis and policy enforcement.

NEW QUESTION # 134

In the zero-trust network access model, which criteria is used for continuous verification to modify trust levels?

- A. Network traffic patterns
- B. Detected threat levels
- C. System patching status
- D. User and device behavior

Answer: D

Explanation:

The Zero Trust model relies on the principle of "never trust, always verify" and includes continuous verification based on real-time data. According to SCAZT Section 1 (Cloud Security Architecture, Pages 14-17), user and device behavior are key elements for continuous verification. Behavioral analytics evaluates deviations from typical activity, such as time of login, geolocation, access frequency, and resource usage to adapt trust levels dynamically. This is central to adaptive access control and risk-based authentication.
