### Cisco Understanding Cisco Cybersecurity Operations Fundamentals Sample Questions (Q187-Q192):

#### NEW QUESTION # 187

An engineer is addressing a connectivity issue between two servers where the remote server is unable to establish a successful session. Initial checks show that the remote server is not receiving an SYN-ACK while establishing a session by sending the first

SYN. What is causing this issue?

- A. incorrect UDP handshake
- **B. incorrect TCP handshake**
- C. incorrect OSI configuration
- D. incorrect snapplen configuration

**Answer: B**

Explanation:

A TCP handshake is a three-way exchange of messages between a client and a server to establish a TCP connection. The client initiates the handshake by sending a SYN packet with a sequence number to the server.

The server responds with a SYN-ACK packet with its own sequence number and an acknowledgment number that is the client's sequence number plus one. The client completes the handshake by sending an ACK packet with an acknowledgment number that is the server's sequence number plus one. If the remote server is not receiving an SYN-ACK packet from the local server, it means that the TCP handshake is not completed and the connection is not established. This could be caused by various factors, such as network congestion, firewall rules, packet filtering, or misconfiguration of the TCP parameters on either end. References :

```
$ cuckoo submit --machine cuckoo1 /path/to/binary
```

Which event is occurring?

- B. A binary named "submit" is running on VM cuckoo1.
- C. A binary on VM cuckoo1 is being submitted for evaluation
- D. A URL is being evaluated to see if it has a malicious binary

**Answer: A**
