## Fire-Inspector-II Practice Exams & Fire-Inspector-II 100% Exam Coverage

Additionally, we offer up to three months of free 67 - Fire Inspector II Exam Fire-Inspector-II exam questions updates. If the actual examination's topics or content changes within three months of your buying, we will immediately provide you with free 67 - Fire Inspector II Exam Fire-Inspector-II exam questions updates. It is the best time to buy actual 67 - Fire Inspector II Exam Fire-Inspector-II Exam Questions at an affordable price with these amazing offers. Don't miss this golden opportunity. Purchasen International Code Council Fire-Inspector-II real exam questions and start preparing for the 67 - Fire Inspector II Exam Fire-Inspector-II certification test today. Good Luck!

## International Code Council 67 - Fire Inspector II Exam Sample Questions (Q52-Q57):

### NEW QUESTION # 52

Given: Scheduling inspections should be done to obtain a high level of efficiency. When scheduling inspections at multiple

occupancies on the same day, the inspector should:

- A. only identify critical violations.
- B. select occupancies with historically low violations.
- **C. select occupancies in the same general area.**
- D. set limits on the time spent at each occupancy.

**Answer: C**

Explanation:

Efficient scheduling minimizes travel time and maximizes inspection coverage, a practical aspect of fire inspection management (not explicitly detailed in the IFC but implied in Section 106.2, Inspections).

Selecting occupancies in the same geographic area (C) reduces travel, allowing more time for thorough inspections. Option A undermines the comprehensive nature of inspections required by IFC Section 106.1.

Option B could compromise inspection quality, not efficiency. Option D focuses on violation history, which doesn't inherently improve scheduling efficiency and may skew priorities. Thus, C is the most logical and IFC-aligned choice.

Reference: IFC 2021, Section 106.2 (Inspections).

### NEW QUESTION # 53

A Type I handrail that is not circular shall have a minimum perimeter dimension of \_\_\_\_ inches.

- **A. 6.25**
- B. 1.25
- C. 0
- D. 1

**Answer: A**

Explanation:

According to the 2021 International Fire Code (IFC) and the International Building Code (IBC) Section 1014.3, handrails are categorized into Type I and Type II based on their shape and size requirements.

Type I handrails refer to those that are not circular in shape but still comply with graspability requirements.

IBC Section 1014.3.1 states that:

If a handrail is not circular, it must have a perimeter dimension between 4 inches (minimum) and 6.25 inches (maximum).

The cross-section of such a handrail should provide an adequate grasping surface.

# Correct answer: D. 6.25 inches

### NEW QUESTION # 54

What is the occupant load of a 50,000 gross square foot airport terminal concourse?

- A. 0
- B. 1
- C. 1,000
- **D. 2,500**

**Answer: D**

Explanation:

To determine the occupant load of a 50,000 gross square foot airport terminal concourse, we use the occupant load factor from 2021 IBC Table 1004.5.

Step 1: Identify the Occupant Load Factor for an Airport Concourse

According to IBC Table 1004.5, the occupant load factor for an airport terminal concourse is 20 sq. ft. per person (gross).

Step 2: Calculate the Occupant Load

$50,000 \div 20 = 2,500$  occupants

Reference to Fire Inspector Documentation:

1. 2021 International Building Code (IBC) - Table 1004.5 (Occupant Load Factor for Airport Concourses)

20 sq. ft. per person is assigned for airport concourses.

2. 2021 International Fire Code (IFC) - Section 1004.1.2 (Occupant Load Determination) Gross area calculations must follow the correct occupant load factor per IBC Table 1004.5.

Detailed Explanation of Answer Choices:

Option A (Incorrect): 200 is too low based on proper calculations.

Option B (Incorrect): 500 is also too low.

Option C (Incorrect): 1,000 is below the required calculation.

Option D (Correct): 2,500 is the correct calculation based on IBC Table 1004.5.

Thus, the correct and verified answer is: D. 2,500.

### NEW QUESTION # 55

When investigating a complaint of a violation within an occupied public area, the fire inspector:

- A. must provide the occupant with at least 24 hours of advance notice.
- B. need not give prior notice of the inspection to the occupant.
- C. must either give prior notice to the occupant or obtain an inspection warrant.
- D. must give prior notice to the occupant.

**Answer: C**

Explanation:

Reference to ICC Fire Code and Legal Authority:

The International Fire Code (IFC) and Standard Inspection Procedures establish that fire inspectors must either obtain consent from the occupant or acquire an inspection warrant if entry is denied.

IFC Section 104.3 (Right of Entry) states that inspectors have the authority to enter a building at reasonable times to conduct an inspection, but if entry is refused, a warrant must be obtained.

Legal and Ethical Considerations:

Fourth Amendment Rights protect against unlawful searches, requiring inspectors to either:

Gain voluntary consent from the occupant, OR

Obtain an inspection warrant if the occupant refuses entry.

Prior notice is not always required, but if the occupant is unavailable or uncooperative, legal measures must be taken.

Clarification of Incorrect Answer Choices:

A: must give prior notice to the occupant # Incorrect

While prior notice is sometimes given as a courtesy, it is not legally required for routine inspections unless mandated by local ordinances.

B: need not give prior notice of the inspection to the occupant # Incorrect While prior notice may not be required, entry still requires consent or a warrant. This answer does not fully address the legal requirement for an inspection warrant if entry is denied.

C: must provide the occupant with at least 24 hours of advance notice # Incorrect No universal 24-hour notice rule exists under the IFC unless specified by local regulations.

Conclusion:

The correct and verified answer is D because fire inspectors must either give prior notice to the occupant or obtain an inspection warrant if entry is refused (IFC Section 104.3).

### NEW QUESTION # 56

Hazardous occupancies involved in the manufacturing of organic coatings:

- A. require only an automatic fire alarm system.
- B. require both manual and automatic fire alarm systems.
- C. require only a manual fire alarm system.
- D. do not require a fire alarm system.

**Answer: B**

Explanation:

Hazardous occupancies involved in organic coatings manufacturing are classified as Group H-2 or H-3 occupancies under the 2021 IFC. These facilities involve highly flammable materials, requiring both manual and automatic fire alarm systems for safety.

IFC 2021, Section 415.7 - Organic Coatings Manufacturing:

Requires that automatic fire alarm and manual fire alarm systems be installed due to the high risk of fire and explosion in these facilities.

IFC 907.2.4 - Fire Alarm Systems for Group H Occupancies:

Specifies that Group H (high-hazard) occupancies must have both manual and automatic fire alarm systems.

The automatic fire alarm system ensures immediate detection, while the manual system allows for human activation in case of

emergencies.

Why Other Options Are Incorrect?

A: Do not require a fire alarm system.

Incorrect, as all high-hazard occupancies require fire alarm systems.

B: Require only a manual fire alarm system.

Incorrect, as automatic detection is also required due to high fire risk.

C: Require only an automatic fire alarm system.

Incorrect, as manual activation is necessary for early intervention.

## NEW QUESTION # 57

.....

Now you need not be worried, if you are run short of time for Fire-Inspector-II exam preparation or your tough work schedule doesn't allow you spare time for studying preparatory guides. Relying on Lead2Passed Fire-Inspector-II Dumps will award an easy course to get through the exam and obtain a credential such as Fire-Inspector-II you ever desired.
