CrowdStrike Certified Cloud Specialist - 2025 Version Sample Questions (Q124-Q129):

NEW QUESTION # 124

What is the primary purpose of Falcon Fusion workflows in CrowdStrike's cloud security ecosystem?

- A. To analyze network traffic for anomalies in real-time.
- B. To automate responses to security events based on predefined triggers.
- C. To monitor and block unauthorized access attempts to cloud resources.
- D. To create new user accounts and assign permissions in CrowdStrike Falcon.

Answer: B

Explanation:
Option A: Falcon Fusion workflows are designed to create automated, action-oriented workflows that trigger in response to specific events. This reduces manual intervention and improves incident response times.
Option B: Falcon Fusion does not analyze network traffic directly. This function is more aligned with Falcon's EDR (Endpoint Detection and Response) capabilities or network security tools.
Option C: While Falcon does monitor and block threats, this is not the specific function of Falcon Fusion workflows. Falcon Fusion focuses on automating workflows in response to events, not directly handling access control.
Option D: User account management is handled through administrative tools and settings within the Falcon console, not Falcon Fusion workflows.

NEW QUESTION # 125
Which method is most effective for identifying Indicators of Attack (IOAs) in a cloud-native environment?

- A. Utilize CrowdStrike's integration with cloud-native APIs for IOA detection
- B. Deploy a CrowdStrike Falcon sensor on all endpoints
- C. Rely on cloud provider security tools like AWS GuardDuty or Azure Security Center
- D. Implement runtime monitoring via Kubernetes native tools such as kube-audit

Answer: A

Explanation:
Option A: Cloud provider tools offer baseline threat detection but lack the advanced IOA analysis capabilities of CrowdStrike. These tools are generally more focused on Indicators of Compromise (IOCs) rather than IOAs, which identify behaviors indicative of an attack.
Option B: Kubernetes auditing tools like kube-audit can provide some insights into cluster activity but are not specialized for detecting IOAs. These tools require significant customization to identify attack behaviors effectively.
Option C: While deploying Falcon sensors provides comprehensive runtime protection and IOA detection, this approach requires installing agents, which may not be feasible in all cloud-native environments. The question focuses on cloud-native environments, where agentless detection may be more relevant.
Option D: CrowdStrike integrates with cloud-native APIs to monitor runtime behavior, detect IOAs, and provide advanced threat protection without requiring agent installation. This approach is highly effective in cloud-native environments where workloads are dynamic and ephemeral.

NEW QUESTION # 126
In Falcon Cloud Security, how is the distinction between assessed and unassessed items most accurately explained?

- A. Assessed items refer to all managed assets, while unassessed items include only unmanaged assets.
- B. Assessed items have been fully patched, while unassessed items have outdated configurations.
- C. Assessed items are container images that have been scanned for vulnerabilities, while unassessed items are those that have not yet been scanned.
- D. Assessed items include containers that are in active use, while unassessed items include archived or inactive containers.

Answer: C

Explanation:
Option A: Assessed items are those, such as container images, that have undergone vulnerability or configuration assessments within Falcon Cloud Security. Unassessed items have not yet been scanned, possibly due to configuration, scope, or timing limitations. Understanding this distinction is critical for prioritizing security tasks.
Option B: The term "assessed" does not equate to being "fully patched." An item can be assessed and still have vulnerabilities that need remediation.

Option C: Assessed and unassessed statuses are not related to the activity or archival state of containers. Both active and inactive containers can be either assessed or unassessed depending on scanning processes.
Option D: Assessed items are not synonymous with managed assets; unmanaged items can also be assessed if scanned through external tools or workflows.

NEW QUESTION # 127

When registering a container registry in Falcon's Image Assessment feature, which of the following parameters is mandatory for a successful connection?

- A. The container registry's Base URL, a scan rule for critical vulnerabilities, and a list of trusted images.
- B. The container registry's Base URL, authentication credentials, and a unique connection name.
- C. The container registry's Base URL, authentication credentials, and an active Image Assessment policy.
- D. The container registry's Base URL, authentication credentials, and a defined repository scan scope.

Answer: B

Explanation:
Option A: Registering a registry requires the Base URL to identify the registry, authentication credentials for access, and a unique connection name to distinguish it in the Falcon console.
Option B: An Image Assessment policy is configured after the registry connection is registered, not as part of the registration process.
Option C: While the Base URL and credentials are mandatory, the repository scan scope is optional and defined later in the scan policy.
Option D: These configurations are related to scan rules and policies, not to the connection setup itself.

NEW QUESTION # 128

An organization has a custom IOM rule in Falcon Cloud Security to detect SSH connections from unauthorized IP addresses. However, the security team needs to update the rule to exclude a newly added internal IP range.
What is the correct way to update this rule?

- A. Edit the IOM rule directly in the Falcon Cloud Security Console.
- B. Use the Falcon CLI to modify the IOM rule in the underlying infrastructure.
- C. Delete the existing IOM rule and create a new one with the updated IP range.
- D. Disable the IOM rule and configure AWS Security Groups to handle IP whitelisting instead.

Answer: A

Explanation:
Option A: Deleting and recreating the rule is inefficient and could lead to downtime or loss of historical data. The rule should be edited instead.
Option B: There is no CLI functionality for modifying IOM rules in Falcon Cloud Security. All IOM rule management is handled through the console.
Option C: Falcon Cloud Security provides a straightforward interface for editing existing custom IOM rules, including modifying IP ranges or other parameters.
Option D: AWS Security Groups are not a replacement for Falcon Cloud Security's IOM rules.
Security Groups are limited to network-level access control and do not offer the runtime detection capabilities of IOM rules.
