Useful EAEP2201 Latest Exam Tips, EAEP2201 Latest Dumps Ebook

DumpsQuestion provides numerous extra features to help you succeed on the EAEP2201 exam, in addition to the Esri EAEP2201 exam questions in PDF format and online practice test engine. These include 100% real questions and accurate answers, 1 year of free updates, a free demo of the Esri EAEP2201 Exam Questions, a money-back guarantee in the event of failure, and a 20% discount. DumpsQuestion is the ideal alternative for your Enterprise Administration Professional 2201 (EAEP2201) test preparation because it combines all of these elements.

Esri Enterprise Administration Professional 2201 Sample Questions (Q61-Q66):

NEW QUESTION # 61

A GIS administrator must share an imagery service with another ArcGIS Enterprise. The administrator sets up a distributed

collaboration with the other ArcGIS Enterprise and shares the service as a reference. The users in the other organization keep being prompted for credentials.

Which action should the administrator perform?

- A. Configure the service with anonymous access
- **B. Share the image service as a copy**
- C. Set the collaboration workspace to send and receive
- D. Save viewer credentials in the collaboration

Answer: B

NEW QUESTION # 62

A small organization has an ArcGIS Enterprise deployment where all components are installed on one virtual server hosted on Microsoft Azure. Each deployment component was initially installed manually. The organization wants to upgrade its deployment to the most recent version in the most efficient way.

Which action should the organization perform?

- **A. Manually upgrade each ArcGIS Enterprise component**
- B. Upgrade the entire deployment with ArcGIS Enterprise Builder
- C. Run the ArcGIS Enterprise Cloud Builder for Microsoft Azure tool

Answer: A

Explanation:

For ArcGIS Enterprise deployments on Microsoft Azure that were initially installed manually, the recommended approach for upgrading is to manually upgrade each component. This involves downloading the latest installers for each component (Portal for ArcGIS, ArcGIS Server, ArcGIS Data Store, etc.) and following the standard upgrade procedures for each. This method ensures that each component is properly updated and configured according to the organization's specific setup.

Using ArcGIS Enterprise Builder (Option B) is intended for new installations and is not suitable for upgrading existing deployments. ArcGIS Enterprise Cloud Builder for Microsoft Azure (Option C) is designed for deployments that were originally created using Cloud Builder; it cannot be used to upgrade deployments that were installed manually.

Reference Source: ArcGIS Enterprise documentation on upgrading manually installed deployments

NEW QUESTION # 63

An ArcGIS analyst is curating a series of basemaps for field crews editing utility infrastructure in the field.

The analyst must ensure optimal performance.

Which type of service should be published?

- **A. Cached map service**
- B. Dynamic map service
- C. Vector tile service

Answer: A

Explanation:

For field operations, Vector Tile Services are highly efficient and suitable for basemaps. They offer fast rendering, smaller file sizes, and are easily scalable across various devices, including those with limited bandwidth or processing capabilities. Vector tiles also support dynamic styling and are ideal for offline use, which is often necessary for field crews working in areas with limited connectivity.

Cached map services (Option A) are raster-based and can be larger in size, making them less optimal for mobile use. Dynamic map services (Option C) require real-time data rendering, which can be resource-intensive and may not perform well in field conditions with limited connectivity.

Reference Source: ArcGIS Enterprise documentation on customizing basemaps

NEW QUESTION # 64

A GIS administrator is architecting a new ArcGIS Enterprise deployment. The organization has grown and evolved since the initial deployment. The organization is having difficulty meeting the existing Service Level Agreement.

Recently, the team rolled out a series of web tools that are used in various applications throughout the organization. In the existing

deployment, users report poor performance when the web tools are used.
Which action should the GIS administrator perform?

- A. Install an additional ArcGIS Enterprise deployment for analysis workflows
- B. Configure additional ArcGIS Server machines within the existing ArcGIS Server site
- **C. Dedicate an ArcGIS Server site for analysis to use workload separation**

Answer: C

Explanation:

Workload separation is a best practice in ArcGIS Enterprise architecture. By dedicating a separate ArcGIS Server site for analysis tasks, such as geoprocessing services used in web tools, system resources can be managed more effectively, and performance can be improved. This configuration avoids overloading a single site and ensures that interactive web applications are not affected by resource-intensive analysis tools.

Adding more machines to the same site (Option A) does not isolate workloads and may still result in contention. Installing an entirely new ArcGIS Enterprise deployment (Option C) increases complexity and administration effort unnecessarily. The recommended solution is to implement a dedicated ArcGIS Server site for analysis as part of a federated multi-site deployment.

NEW QUESTION # 65

A client requires an ArcGIS Server site with the ability to:

* Serve cached image services updated annually

* Serve dynamic feature services from a PostgreSQL enterprise geodatabase Which ArcGIS Server license role is required?

- A. GeoAnalytics Server
- **B. Image Server**
- C. GIS Server
- D. Mission Server

Answer: B

Explanation:

To publish and serve cached image services, the ArcGIS Server must be licensed as an Image Server. This licensing role is designed specifically for serving raster datasets, image services, and cache-based imagery workflows.

From ArcGIS Server documentation:

"The Image Server role is required to publish and manage image services, including those that serve pre-generated tile caches and support raster analytics."

* Option A (GIS Server) supports feature and map services, but not cached imagery.

* Option C (Mission Server) is for real-time operations, unrelated to imagery or features.
