Salesforce Platform Developer I (PDI) Sample Questions (Q30-Q35):

NEW QUESTION # 30
What are three considerations when using the @InvocableMethod annotation in Apex?
Choose 3 answers

- A. A method using the @InvocableMethod annotation can be declared as Public or Global.
- B. Only one method using the @InvocableMethod annotqation can be defined per Apex class.
- C. A method using the @InvocableMethod annotation must be declared as static
- D. A method using the @InvocableMethod annotation must define a return value.
- E. A method using the @InvocableMethod annotation can have multiple input parameters.

Answer: A,B,C

NEW QUESTION # 31

A developer created a trigger on the Account object and wants to test if the trigger is properly bulkified. The developer team decided that the trigger should be tested with 200 account records with unique names.

What two things should be done to create the test data within the unit test with the least amount of code?

Choose 2 answers

- A. Create a static resource containing test data.
- B. Use the @isTest (seeAllData=true) annotation in the test class.
- C. Use Test.loadData to populate data in your test methods.
- D. Use the @isTest (isParallel=true) annotation in the test class.

Answer: A,C

Explanation:

To test the trigger with 200 account records with unique names using the least amount of code:

Option A: Use Test.loadData to populate data in your test methods.

Reference:

"Test.loadData lets you populate test records by loading the contents of a CSV file into sObjects for use in test methods."

- Apex Developer Guide: Using Test.loadData

Option B: Create a static resource containing test data.

"Create a static resource that contains the .csv file for the records you want to load."

- Apex Developer Guide: Loading Test Data from Static Resources

Why Other Options Are Incorrect:

Option C: The @isTest(isParallel=true) annotation is used to run tests in parallel but does not help in creating test data.

Option D: Using @isTest(seeAllData=true) allows access to existing org data, which is not recommended and does not help create unique test data with minimal code.

NEW QUESTION # 32

A software company is using Salesforce to track the companies they sell their software to in the Account object. They also use Salesforce to track bugs in their software with a custom object, Bug__c.

As part of a process improvement initiative, they want to be able to report on which companies have reported which bugs. Each company should be able to report multiple bugs and bugs can also be reported by multiple companies.

What is needed to allow this reporting?

- A. Function object between Bug__c and Account
- B. Roll-up summary field of Bug_c on Account
- C. Lookup field on Bug_c to Account
- D. Master-detail field on Bug_c to Account

Answer: A

Explanation:

* Many-to-Many Relationship:
* To track which companies (Accounts) report which bugs and allow multiple associations for both, a junction object is needed.
* This junction object will have two master-detail relationships: one to Bug__c and one to Account.
* Why Not Other Options?
* A. Roll-up summary field: Not suitable for many-to-many relationships.
* B. Master-detail field on Bug__c to Account: Creates a one-to-many relationship, not many-to- many.
* C. Lookup field on Bug__c to Account: Still creates a one-to-many relationship, not many-to- many.

NEW QUESTION # 33

A team of many developers work in their own individual orgs that have the same configuration as the production org.

Which type of org is best suited for this scenario?

- A. Full Sandbox

- B. Partner Developer Edition
- C. Developer Edition
- D. Developer Sandbox

Answer: D

Explanation:
Option C: Developer Sandbox
Correct Answer.
Developer Sandboxes are intended for coding and testing by a single developer.
They copy all application and configuration information from production, ensuring the same metadata.
Each developer can work in their own isolated environment.
Full Sandboxes include all data and are often limited in number.
They are better suited for performance testing and staging.
Option B: Developer Edition
Incorrect.
Developer Edition orgs do not mirror production configurations.
They are standalone orgs with limited features.
Option A: Partner Developer Edition
Incorrect.
Intended for ISV partners to develop and package applications.
Conclusion:
The best-suited org type is Developer Sandbox, which is Option C.
Reference:
Sandbox Types and Templates
Option D: Full Sandbox
Not Ideal for Individual Developers.
