ECCouncil Certified Ethical Hacker Exam (CEHv13) Sample Questions (Q459-Q464):

NEW QUESTION # 459

Fingerprinting an Operating System helps a cracker because:

- A. It opens a security-delayed window based on the port being scanned
- B. It doesn't depend on the patches that have been applied to fix existing security holes
- **C. It informs the cracker of which vulnerabilities he may be able to exploit on your system**
- D. It defines exactly what software you have installed

Answer: C

NEW QUESTION # 460

During a recent vulnerability assessment of a major corporation's IT systems, the security team identified several potential risks. They want to use a vulnerability scoring system to quantify and prioritize these vulnerabilities. They decide to use the Common Vulnerability Scoring System (CVSS). Given the characteristics of the identified vulnerabilities, which of the following statements is the most accurate regarding the metric types used by CVSS to measure these vulnerabilities?

- A. Temporal metric involves measuring vulnerabilities based on a specific environment or implementation
- B. Temporal metric represents the inherent qualities of a vulnerability
- C. Environmental metric involves the features that change during the lifetime of the vulnerability
- **D. Base metric represents the inherent qualities of a vulnerability**

Answer: D

Explanation:

The base metric represents the inherent qualities of a vulnerability, according to the Common Vulnerability Scoring System (CVSS). CVSS is a framework that numerically characterizes the severity of software vulnerabilities between the range of 0-10. CVSS consists of three metric groups: Base, Temporal, and Environmental. The base metric group captures the characteristics of a vulnerability that are constant over time and across user environments. The base metric group consists of six sub-metrics: Attack Vector, Attack Complexity, Privileges Required, User Interaction, Scope, and Impact. The impact sub-metric further consists of three sub-metrics: Confidentiality, Integrity, and Availability. The base metric group produces a score ranging from 0 to 10, which reflects the intrinsic and fundamental properties of a vulnerability¹².

The other options are not correct for the following reasons:

A). Temporal metric represents the inherent qualities of a vulnerability: This option is incorrect because the temporal metric group captures the characteristics of a vulnerability that change over time due to events external to the vulnerability. The temporal metric group consists of three sub-metrics: Exploit Code Maturity, Remediation Level, and Report Confidence. The temporal metric group modifies the base score to reflect the current state of the vulnerability, such as the availability of exploit code, the existence of patches or workarounds, and the degree of verification of the vulnerability report¹².

C). Environmental metric involves the features that change during the lifetime of the vulnerability: This option is incorrect because the environmental metric group captures the characteristics of a vulnerability that are relevant and unique to a user's environment. The environmental metric group consists of three sub-metrics:

Modified Attack Vector, Modified Attack Complexity, and Modified Privileges Required. The environmental metric group also allows the user to assign importance values to the impact sub-metrics: Confidentiality Requirement, Integrity Requirement, and Availability Requirement. The environmental metric group modifies the base and temporal scores to reflect the impact of the vulnerability on the user's specific environment, such as the network configuration, the security objectives, and the asset value¹².

D). Temporal metric involves measuring vulnerabilities based on a specific environment or implementation:

This option is incorrect because the temporal metric group does not involve measuring vulnerabilities based on a specific environment or implementation, but rather on the factors that change over time due to events external to the vulnerability. The environmental metric group, not the temporal metric group, involves measuring vulnerabilities based on a specific environment or implementation, as explained in option C.

NEW QUESTION # 461

Which of the following is considered an exploit framework and has the ability to perform automated attacks on services, ports, applications and unpatched security flaws in a computer system?

- A. Nessus
- B. Wireshark

- C. Metasploit
- D. Maltego

Answer: C

Explanation:

https://en.wikipedia.org/wiki/Metasploit_Project

The Metasploit Project is a computer security project that provides information about security vulnerabilities and aids in penetration testing and IDS signature development. It is owned by Boston, Massachusetts-based security company Rapid7.

Its best-known sub-project is the open-source Metasploit Framework, a tool for developing and executing exploit code against a remote target machine. Other important sub-projects include the Opcode Database, shellcode archive and related research.

The Metasploit Project includes anti-forensic and evasion tools, some of which are built into the Metasploit Framework. Metasploit is pre-installed in the Kali Linux operating system.

The basic steps for exploiting a system using the Framework include.

1. Optionally checking whether the intended target system is vulnerable to an exploit.
2. Choosing and configuring an exploit (code that enters a target system by taking advantage of one of its bugs; about 900 different exploits for Windows, Unix/Linux and macOS systems are included).
3. Choosing and configuring a payload (code that will be executed on the target system upon successful entry; for instance, a remote shell or a VNC server). Metasploit often recommends a payload that should work.
4. Choosing the encoding technique so that hexadecimal opcodes known as "bad characters" are removed from the payload, these characters will cause the exploit to fail.
5. Executing the exploit.

This modular approach - allowing the combination of any exploit with any payload - is the major advantage of the Framework. It facilitates the tasks of attackers, exploit writers and payload writers.

NEW QUESTION # 462

A large company intends to use BlackBerry for corporate mobile phones and a security analyst is assigned to evaluate the possible threats. The analyst will use the Blackjacking attack method to demonstrate how an attacker could circumvent perimeter defenses and gain access to the corporate network. What tool should the analyst use to perform a Blackjacking attack?

- A. Bloover
- B. BBcrack
- C. Paros Proxy
- D. BBProxy

Answer: D

Explanation:

The Blackjacking attack involves leveraging a compromised BlackBerry device and its connection through the BlackBerry Enterprise Server (BES) to tunnel back into the internal corporate network, bypassing perimeter firewalls. The tool used in this method is BBProxy.

BBProxy is installed on the BlackBerry device and establishes a covert tunnel via BES, allowing attackers to pivot into the internal LAN from outside the perimeter.

Reference - CEH v13 Official Study Guide:

Module 17: Hacking Mobile Platforms

Quote:

"Blackjacking is a technique in which attackers use BBProxy to exploit a trusted path from a BlackBerry device to the corporate LAN through BES." Incorrect Options Explained:

- A). Paros Proxy is a web proxy used for intercepting HTTP/S traffic.
- C). Bloover is used for Bluetooth security auditing.
- D). BBcrack is used for password recovery on BlackBerry devices, not for tunneling.

NEW QUESTION # 463

A penetration tester is assessing an organization's cloud infrastructure and discovers misconfigured IAM policies on storage buckets. The IAM settings grant read and write permissions to any authenticated user.

What is the most effective way to exploit this misconfiguration?

- A. Use leaked API keys to access the cloud storage buckets and exfiltrate data

- **B. Create a personal cloud account to authenticate and access the misconfigured storage buckets**
- C. Perform a Cross-Site Scripting (XSS) attack on the cloud management portal to gain access
- D. Execute a SQL injection attack on the organization's website to retrieve sensitive information

Answer: B

Explanation:

CEH notes that cloud IAM misconfigurations can unintentionally grant broad access. If any authenticated cloud account is permitted read/write access, attackers can simply authenticate with their own cloud identity and directly interact with the misconfigured storage buckets, enabling data exfiltration or manipulation.
