Exam UiPath-ADPv1 Tutorials | UiPath-ADPv1 Valid Learning Materials

About the upcoming UiPath-ADPv1 exam, do you have mastered the key parts which the exam will test up to now? Everyone is conscious of the importance and only the smart one with smart way can make it. Maybe you are unfamiliar with our UiPath-ADPv1 Latest Material, but our UiPath-ADPv1 real questions are applicable to this exam with high passing rate up to 98 percent and over.

UiPath UiPath-ADPv1 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Design and Development: This section covers designing workflows using sequences, flowcharts, and state machines, building reusable components with libraries, exception handling and debugging techniques, etc.
Topic 2	<ul style="list-style-type: none">Debugging and Testing: This section is about utilizing logging and debugging tools and adopting unit testing and test automation strategies.
Topic 3	<ul style="list-style-type: none">UiPath Activities: In this section, the discussion is related to various UiPath activities for UI interaction, data manipulation, control flow, and more.
Topic 4	<ul style="list-style-type: none">UiPath Studio Fundamentals: In this section, the focus is given to the understanding of Robotic Process Automation (RPA) concepts; it covers UiPath Studio and its components, Working with the UiPath user interface, project creation, management, and version control.

UiPath (ADPv1) Automation Developer Professional Sample Questions (Q163-Q168):

NEW QUESTION # 163

When using Profile Execution to analyze performance, what should you keep in mind about the data generated during debugging versus data generated during production runs?

- A. Profiling data from debugging sessions may differ from production runs.
- B. Profiling data from debugging sessions will always be the same as production runs.
- C. Profiling data is only available during production runs, not debugging sessions.
- D. Profiling data is stored only for debugging sessions, not production runs.

Answer: A

Explanation:

The Profile Execution tool in Studio can be used in both Run and Debug modes. However, it's important to note that profiling data may vary between debugging and production runs due to differences in execution behavior (e.g., breakpoints, step-by-step execution, and extra logging during debugging).

Reference: UiPath Studio Guide > Debugging > Profile Execution

NEW QUESTION # 164

When configuring the Max # of retries for the queue in Orchestrator to "1" for your process, and the queue has 5 transaction items. At runtime, the first transaction item throws a Business Rule Exception. How does the process proceed?

- A. Transaction is retried multiple times until processed successfully.
- B. Transaction is not retried but remaining transactions continue processing.
- C. Transaction is retried only one time.
- D. Transaction is not retried and the process stops.

Answer: B

Explanation:

A Business Rule Exception is a type of exception that indicates that the data or the input required for the automation process is incomplete or invalid¹. For example, a Business Rule Exception can occur when a phone number is missing a digit, or when a mandatory field is left blank¹. A Business Rule Exception is usually thrown by the developer using the Throw activity, and it is handled by the Set Transaction Status activity, which sets the status of the transaction item to Failed and adds the exception details to the queue item². By default, Orchestrator does not retry transactions that are failed due to Business Rule Exceptions, regardless of the Max # of retries setting for the queue³. This is because retrying the transaction does not solve the issue, and there are other better courses of action, such as notifying the human user of the error¹.

Therefore, if the first transaction item throws a Business Rule Exception, the transaction is not retried, but the remaining transactions continue processing, as long as they do not encounter any other exceptions.

NEW QUESTION # 165

You are building an automation for a CRM system where customer data from various sources needs to be reviewed and consolidated into a single record before being entered into the system.

What is the best strategy for handling the data?

- A. Create individual variables for each customer data field and manually merge them in the final step before entering the CRM system.
- B. Use attended workflows to review each piece of customer data separately before manually entering it into the CRM system.
- C. Consolidate all customer data into a single entity that can be reviewed and processed before final entry into the CRM system.
- D. Store the customer data in multiple files, then manually transfer the information between workflows.

Answer: C

Explanation:

The best approach for data consolidation is to aggregate all customer data into a single entity or structure, such as a dictionary, object, or entity (especially when using Data Service). This allows for centralized review, validation, and manipulation before being processed into the CRM system. It ensures data consistency, reusability, and easier error handling.

Reference: UiPath Best Practices Guide > Data Handling > Structured Data Management

NEW QUESTION # 166

A developer designed a process in the REFramework using Orchestrator queues. In which state(s) will be the status updated for each Transaction Item in the queue?

- A. Process Transaction only.
- **B. Get Transaction Data and Process Transaction.**
- C. Initialization and Get Transaction Data.
- D. Initialization and Process Transaction.

Answer: B

Explanation:

In the REFramework using Orchestrator queues, the status of each Transaction Item in the queue is updated in two states: 'Get Transaction Data' and 'Process Transaction'. This ensures proper tracking and processing of each item.

NEW QUESTION # 167

What Is the role of server-side event triggers In UiPath Integration Service?

- A. To start UiPath processes only when users interact with specific UI elements.
- B. To manage API connections and authorize usage across different security protocols.
- C. To notify users when a new connector is available In the UiPath Integration Service catalog.
- **D. To start UiPath processes by configuring events such as data updates, insertions or deletions in other systems.**

Answer: D

Explanation:

Server-side event triggers in UiPath Integration Service are used to automatically start UiPath processes in response to certain events, like data updates, insertions, or deletions in other systems. This allows for a high level of automation integration.

NEW QUESTION # 168
