Free PDF 2026 CheckPoint 156-836: Trustable Check Point Certified Maestro Expert - R81 (CCME) Sample Questions Pdf

As we all know, a lot of efforts need to be made to develop a 156-836 learning prep. Firstly, a huge amount of first hand materials are essential, which influences the quality of the compilation about the 156-836 actual test guide. We have tried our best to find all reference books. Then our experts have carefully summarized all relevant materials of the 156-836 exam. Also, annual official test is also included. They have built a clear knowledge frame in their minds before they begin to compile the 156-836 Actual Test guide. It is a long process to compilation. But they stick to work hard and never abandon. Finally, they finish all the compilation because of their passionate and persistent spirits. So you are lucky to come across our 156-836 exam questions.

CheckPoint Check Point Certified Maestro Expert - R81 (CCME) Sample

Questions (Q48-Q53):

NEW QUESTION # 48
What kinds of transceivers are supported on Orchestrator MHO-170?

- A. SFP, SFP+, SFP28
- B. SFP+, SFP28, QSFP
- C. QSFP, QSFP28
- D. SFP, QSFP, QSFP28

Answer: C

Explanation:
The Orchestrator MHO-170 supports QSFP and QSFP28 transceivers on its 32x 100 GbE ports. QSFP stands for Quad Small Form-factor Pluggable and QSFP28 is an enhanced version of QSFP that supports up to 28 Gbps per lane. These transceivers can provide high-speed and high-density connectivity for the Maestro environment.

NEW QUESTION # 49
What is a downlink interface used for?

- A. To connect Orchestrators to customer's infrastructure
- B. To connect appliances to customer's infrastructure
- C. To connect in between Orchestrators
- D. To connect appliances to Orchestrators

Answer: B

NEW QUESTION # 50
Common Layer 1 issues include

- A. MAC addresses
- B. Distribution
- C. Loose or bad cables
- D. Routing

Answer: C

NEW QUESTION # 51
There are two appliances within the same Security Group. One of them is connected by One downlink only, another one by Two downlinks. Assuming there's no NAT and no VPN, what would be proportion of traffic distribution done by Orchestrator?

- A. 100%/0%
- B. 66%/33%
- C. 33%/66%
- D. 50%/50%

Answer: D

Explanation:
Explanation
The proportion of traffic distribution done by Orchestrator depends on the traffic distribution mode that is configured for the Security Group. There are three modes: Round Robin, Load Sharing, and Active/Standby1.
*Round Robin mode distributes the traffic equally among all the appliances in the Security Group, regardless of the number of downlinks they have. This mode is suitable for scenarios where all the appliances have similar performance and capacity. In this mode, the proportion of traffic distribution would be 50%/50% for two appliances with one and two downlinks respectively.

*Load Sharing mode distributes the traffic proportionally to the number of downlinks each appliance has. This mode is suitable for scenarios where the appliances have different performance and capacity. In this mode, the proportion of traffic distribution would be 33%/66% for two appliances with one and two downlinks respectively.

*Active/Standby mode distributes the traffic to only one appliance at a time, while the other appliances are in standby mode. This mode is suitable for scenarios where high availability is required. In this mode, the proportion of traffic distribution would be 100%/0% or 0%/100% for two appliances with one and two downlinks respectively, depending on which appliance is active. Since the question does not specify the traffic distribution mode, the default mode is Round Robin2.

Therefore, the proportion of traffic distribution would be 50%/50% for two appliances with one and two downlinks respectively.

NEW QUESTION # 52

What is the Correction Layer mechanism?

- A. The MHO's distribution algorithm which determines the handling SGM for a given connection.
- B. Enforces the access policy on the SGMs and synchronizes the enforcement verdict to other SGMs in the SG.
- C. The load-balancing mechanism used by the MHO.
- D. Ensures asymmetric traffic is handled properly, especially in the case of NAT or VPNs.

Answer: D

Explanation:
The Correction Layer mechanism is a Maestro component that ensures that packets from the same connection are handled by the same Security Group Module (SGM) in a multi-appliance system. This is especially important when NAT or VPNs are involved, as packets sent from the client to the server can be distributed to a different SGM than packets from the same session sent from the server to the client. The Correction Layer must then forward the packet to the correct SGM.
