Pass Guaranteed 2026 Newest Lpi 010-160: Linux Essentials Certificate Exam - version 1.6 Pass Test

If you are preparing for the practice exam, we can make sure that the 010-160 study materials from our company will be the best choice for you, and you cannot find the better study materials than our company'. There are a lot of advantages of our 010-160 Study Materials, and then, I am going to introduce the special functions of our 010-160 study materials in detail to you. We are hopeful that you will like our products.

Lpi 010-160 exam, also known as the Linux Essentials Certificate Exam, version 1.6, is a certification exam that focuses on the fundamental knowledge and skills required for using Linux operating systems. 010-160 exam is designed for individuals who are new to Linux or have limited experience with it. 010-160 Exam covers essential topics such as command-line basics, file management, text editing, and system security.

Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q69-Q74):

NEW QUESTION # 69

What information can be displayed by top?

- A. User accounts, ordered by the number of logins.
- B. User groups, ordered by the number of members.
- C. Running processes, ordered by CPU or RAM consumption.
- D. Existing files, ordered by their size.
- E. User accounts, ordered by the number of files.

Answer: C

Explanation:

The top command is a Linux command that shows the running processes on the system. It provides a dynamic real-time view of the system performance and resource usage. The top command can display various information about the processes, such as their process ID, user, priority, state, CPU and memory usage, command name, and more. The top command can also sort the processes by different criteria, such as CPU or RAM consumption, by using the interactive commands. The top command is useful for monitoring the system load and identifying the processes that are consuming the most resources. Reference:

Linux Essentials Topic 104: The Linux Operating System, section 104.3: Basic features and commands of the Linux standard shells.

Linux Essentials Topic 106: Security and File Permissions, section 106.4: Monitor and manage Linux processes.

NEW QUESTION # 70

Which of the following characters in a shell prompt indicates the shell is running with root privileges?

- A. \$
- B. #
- C. &
- D. !
- E. *

Answer: B

Explanation:

Explanation

The shell prompt is a symbol or a string of characters that indicates the shell is ready to accept commands. The shell prompt can be customized by the user or by the system administrator. The default shell prompt for a normal user is usually a dollar sign (\$), while the default shell prompt for the root user is usually a hash sign (#). The root user is the superuser or the administrator of the system, who has full access and control over all files, commands, and resources. Running commands as root can be dangerous, as it can cause irreversible damage to the system if done incorrectly. Therefore, it is advisable to use sudo or su to run commands as root only when necessary, and to switch back to a normal user as soon as possible. The shell prompt indicates the shell is running with root privileges when it ends with a hash sign (#). References:

NEW QUESTION # 71

Which of the following commands creates the ZIP archive poems.zip containing all files in the current directory whose names end in .txt?

- A. zip poems.zip *.txt
- B. zip *.txt > poems.zip
- C. cat *.txt | zip poems.zip
- D. zcat *.txt poems.zip
- E. zip cfz poems.zip *.txt

Answer: A

NEW QUESTION # 72

Which of the following directories must be mounted with read and write access if it resides on its own dedicated file system?

- A. /opt
- B. /lib
- C. /var
- D. /etc
- E. /usr

Answer: C

Explanation:

Explanation

The /var directory must be mounted with read and write access if it resides on its own dedicated file system. The reason is that the /var directory contains files and directories that are expected to change in size and content as the normal operation of the system progresses, such as logs, spool files, and temporary files¹.

Therefore, the /var directory needs to have enough space and permission to accommodate these changes. If the /var directory is mounted as read-only, some system services and applications may fail to start or function properly².

The other options are not directories that must be mounted with read and write access if they reside on their own dedicated file system. The /opt directory contains optional or third-party software packages that are not part of the default installation¹. The /lib directory contains libraries and kernel modules that are essential for the binaries in /bin and /sbin directories¹. The /etc directory contains configuration files for the system and applications¹. The /usr directory contains user-related programs, libraries, documentation, and data¹. These directories are usually mounted as read-only to prevent accidental or malicious modification of their contents³. References:
