We are always efficient and give you the best support. You can contact us online any time for information and support for your exam related issues. Our devoted staff will respond you 24/7.

CyberArk CDE-CPC Recertification Sample Questions (Q44-Q49):

NEW QUESTION # 44

Which external-facing IP addresses need to be provided to CyberArk when configuring Privilege Cloud so that they can be allowedlist?

- A. Cloud Connectors and Secrets Manager (if installed)
- B. All users who are Administrators in Privilege Cloud
- C. On-premises backup servers
- D. All users that will be accessing Privilege Cloud

Answer: A

Explanation:

CyberArk's Privilege Cloud network requirements state that, to secure the service, CyberArk permits inbound traffic only from specific IP addresses and you must provide CyberArk Support with the public-facing IP addresses for communication between the Privilege Cloud service and the Connectors, including Secrets Manager-so they can add them to the CyberArk allowlist. That statement maps directly to A.

NEW QUESTION # 45

Which method can be used to directly authenticate users to PSM for SSH? (Choose three.)

- A. Windows authentication
- B. SAML authentication
- C. LDAP authentication
- D. CyberArk authentication
- E. RADIUS authentication
- F. OpenID Connect (OIDC) authentication

Answer: C,D,E

Explanation:

CyberArk states that users can authenticate to the Vault through PSM for SSH using:

- * CyberArk password authentication (i.e., CyberArk authentication),
- * LDAP, and
- * RADIUS (including challenge-response).

Windows, SAML, and OIDC are not listed as direct PSM for SSH authentication methods in the PSM for SSH authentication configuration (Privilege Cloud / PSM for SSH uses the configured PSM for SSH authentication methods such as Password/LDAP/RADIUS)

NEW QUESTION # 46

Before you can delete a Safe, you must first delete all of its content (accounts and files) permanently. What else must also be achieved before the Safe can be successfully deleted?

- A. The version retention period has expired for all files.
- B. The "Save account versions for a period of:" has been set to 0 within the Safe version retention settings.
- C. The associated CPM user has been removed from the Safe.
- D. The Safe owners have been removed from the Safe membership.

Answer: A

Explanation:

CyberArk states that a Safe can be deleted only after its contents are deleted permanently, and (critically) objects are only deleted permanently after their retention/versions retention has passed. In the Privilege Cloud Safe management documentation, it notes that accounts are deleted permanently only after their retention period has passed, which is why deletion can be blocked by "non-expired" objects.

The underlying Vault/PACLI behavior is also explicit: "It is only possible to delete a Safe after the version retention period has expired for all files contained in the Safe." So, beyond deleting the content, the version retention period must have expired for all files # B.

NEW QUESTION # 47

In the directory lookup order, which directory service is always looked up first for the CyberArk Privilege Cloud solution?

- A. CyberArk Cloud Directory
- B. Active Directory
- C. Federated Directory
- D. LDAP

Answer: A

Explanation:

In the directory lookup order for the CyberArk Privilege Cloud solution, the "CyberArk Cloud Directory" is always looked up first. This directory service is a part of the CyberArk Privilege Cloud infrastructure and is specifically designed to handle identity and access management within the cloud environment efficiently. It prioritizes the CyberArk Cloud Directory for authentication and identity resolution before consulting any external directory services.

Reference: CyberArk's architectural documentation usually emphasizes the role of the CyberArk Cloud Directory in managing and authenticating user access in cloud-based deployments, highlighting its precedence in the directory lookup process.

NEW QUESTION # 48

When calling the PSM Health Check Webservice to assess the state of a PSM node, which response code does a healthy node return?

- A. 200 (OK)
- B. 404 (OK)
- C. 503 (OK)
- D. 500 (OK)

Answer: A

Explanation:

CyberArk documents that the health check service returns HTTP 200 (OK) when the PSM service is healthy, and returns 503 (Service unavailable) when it is not healthy (in code-based behavior).

NEW QUESTION # 49

.....

Do you often feel that the product you have brought is not suitable for you? I would like to tell you that you will never meet the problem when you decide to use our CPC-CDE-RECERT learning guide. Our CPC-CDE-RECERT study materials have a high quality that you can't expect. If you do experience by the guidance of our CPC-CDE-RECERT Study Materials, you will spend less time than you did before, you will obviously feel your progress, and you will find our CPC-CDE-RECERT test quiz are so useful to help you make progress.
