## GH-200 Dumps Discount, Certificate GH-200 Exam

Knowledge is defined as intangible asset that can offer valuable reward in future, so never give up on it and our GH-200 exam preparation can offer enough knowledge to cope with the exam effectively. To satisfy the needs of exam candidates, our experts wrote our GH-200 practice materials with perfect arrangement and scientific compilation of messages, so you do not need to study other numerous materials to find the perfect one anymore. Our GH-200 Exam Quiz will offer you the best help. And our GH-200 training material will never let you down.

## Microsoft GitHub Actions Sample Questions (Q83-Q88):

### NEW QUESTION # 83

As a developer, you have a 10-MB data set that is required in a specific workflow. Which steps should you perform so the dataset is stored encrypted and can be decrypted during the workflow? (Choose three.)

- **A. Store the encryption keys in a GitHub encrypted secret.**

- B. Leverage the actions/download-secret action in the workflow.
- **C. Encrypt the dataset.**
- D. Commit the encrypted dataset to the same repository as the workflow
- E. Create a GitHub encrypted secret with the Large object option selected and upload the dataset.
- **F. Store the dataset in a GitHub encrypted secret.**
- G. Compress the dataset

**Answer: A,C,F**

Explanation:

First, the dataset should be encrypted before being stored. This ensures that the data is protected when stored in a repository.

The encrypted dataset can be stored in a GitHub secret, ensuring it is securely kept and not exposed publicly.

The encryption key needed to decrypt the dataset should also be stored in a GitHub secret to maintain security during the workflow, allowing access only when needed.

#### NEW QUESTION # 84

As a developer, you need to leverage Redis in your workflow. What is the best way to use Redis on a self-hosted Linux runner without affecting future workflow runs?

- A. Add a run step to your workflow, which dynamically installs and configures Redis as part of your job.
- B. Set up Redis on a separate machine and reference that instance from your job.
- C. Install Redis on the hosted runner image and place it in a runner group. Specify label: in your job to target the runner group.
- **D. Specify container: and services: in your job definition to leverage a Redis service container.**

**Answer: D**

Explanation:

Creating Redis service containers

You can use service containers to create a Redis client in your workflow. You can create a Redis service for jobs that run in containers or directly on the runner machine.

Configuring the runner job

The example uses the ubuntu-latest GitHub-hosted runner as the Docker host.

The workflow configures a service container with the label redis.

jobs:

# Label of the runner job

runner-job:

# You must use a Linux environment when using service containers or container jobs runs-on: ubuntu-latest

# Service containers to run with `runner-job`

services:

# Label used to access the service container

redis:

# Docker Hub image

image: redis

# Set health checks to wait until redis has started

options: >-

--health-cmd "redis-cli ping"

--health-interval 10s

--health-timeout 5s

--health-retries 5

ports:

# Maps port 6379 on service container to the host

- 6379:6379

Reference:

<https://docs.github.com/en/actions/tutorials/use-containerized-services/create-redis-service-containers>

#### NEW QUESTION # 85

As a DevOps engineer, you need to execute a deployment to different environments like development and testing based on the labels added to a pull request. The deployment should use the releases branch and trigger only when there is a change in the files under 'apps' folder. Which code block should be used to define the deployment workflow trigger?

- A. on:  
pull\_request:  
types: [labeled]  
branches:  
- 'releases/\*\*'  
paths:  
- 'apps'
- B. on:  
pull\_request\_review:  
types: [labeled]  
branches:  
- 'releases'  
paths:  
- 'apps/\*\*'
- C. on:  
pull\_request:  
types: [labeled]  
branches:  
- 'releases'  
paths:  
- 'apps/\*\*'
- D. on:  
pull\_request\_label:  
branches:  
- 'releases'  
paths:  
- 'apps/\*\*'

**Answer: C**

Explanation:

Incorrect:

[Not A] pull\_request activity type labeled not specified.

pull\_request\_label is not a trigger.

[Not B] Specifies branches that has a name that starts with releases. We are only interested in the release branch.

branches:

- 'releases/\*\*'

[Not C]

pull\_request\_review

Runs your workflow when a pull request review is submitted, edited, or dismissed. A pull request review is a group of pull request review comments in addition to a body comment and a state.

Reference:

<https://docs.github.com/en/actions/reference/workflows-and-actions/events-that-trigger-workflows>

## NEW QUESTION # 86

As a developer, how should you enable step debug logging for a workflow?

- A. Include the following code block in your workflow:  
defaults:  
ACTIONS\_STEP\_DEBUG: true
- B. Set the ACTIONS\_STEP\_DEBUG secret or variable at the repository level to true.
- C. Use the --actions-step-debug flag when calling the workflow.
- D. Include the following code block in your workflow:  
env:  
ACTIONS\_STEP\_DEBUG: true

**Answer: B**

Explanation:

### Enabling debug logging

If the workflow logs do not provide enough detail to diagnose why a workflow, job, or step is not working as expected, you can enable additional debug logging.

### Enabling step debug logging

Step debug logging increases the verbosity of a job's logs during and after a job's execution.

1. To enable step debug logging, set the following secret or variable in the repository that contains the workflow:

ACTIONS\_STEP\_DEBUG to true. If both the secret and variable are set, the value of the secret takes precedence over the variable.

2. After setting the secret or variable, more debug events are shown in the step logs.

Reference:

<https://docs.github.com/en/actions/how-tos/monitor-workflows/enable-debug-logging>

### NEW QUESTION # 87

Which configuration lines correctly set the workflow name in a GitHub Actions workflow file?

(Choose 2)

- A. name: release-flow-42
- B. name: \${{ 'release-flow-42' }}
- C. name: \${{ 'release-flow-42' }}
- D. run-name: release-flow-42

**Answer: A,C**

Explanation:

The correct options are name: release-flow-42 and name: \${{ 'release-flow-42' }}. Both set the workflow name that appears in the Actions interface and on the workflow page.

The plain static name key with a simple string sets the workflow name clearly and predictably. It is the most straightforward way to define the workflow title.

The expression form with a single quoted string evaluates to the same literal value. GitHub Actions accepts a string result for the workflow name, so this produces a valid name while keeping consistency with other places where expressions are used.

### NEW QUESTION # 88

.....

The print option of this format allows you to carry a hard copy with you at your leisure. We update our GitHub Actions (GH-200) pdf format regularly so keep calm because you will always get updated GitHub Actions (GH-200) questions. Dupleader offers authentic and up-to-date GitHub Actions (GH-200) study material that every candidate can rely on for good preparation. Our top priority is to help you pass the GitHub Actions (GH-200) exam on the first try.
