

Free PDF Quiz 2026 First-grade Salesforce Mule-Dev-202: Latest Salesforce Certified MuleSoft Hyperautomation Developer Exam Papers

If you can have the certification, you can enter the company you like as well as improve your salary. Mule-Dev-202 training materials of us can offer you such opportunity, since we have a professional team to compile and verify, therefore Mule-Dev-202 exam materials are high quality. You can pass the exam just one time. In addition, Mule-Dev-202 Exam Dumps contain both questions and answers, so that you can have a quick check after practicing. We offer you free update for one year, and the update version for Mule-Dev-202 exam materials will be sent to your email address automatically.

After years of unremitting efforts, our Mule-Dev-202 exam materials and services have received recognition and praises by the vast number of customers. An increasing number of candidates choose our Mule-Dev-202 study braindumps as their exam plan utility. There are a lot of advantages about our Mule-Dev-202 training guide. Not only our Mule-Dev-202 learning questions are always the latest and valid, but also the prices of the different versions are quite favourable.

100% Pass High Pass-Rate Salesforce - Latest Mule-Dev-202 Exam Papers

Our Mule-Dev-202 study braindumps are designed in the aim of making the study experience more interesting and joyful. Through pleasant learning situation and vivid explanation of our Mule-Dev-202 exam materials, you will become more interested in learning. Please accept our Mule-Dev-202 learning prep and generate a golden bowl for yourself. We are waiting for your wise decision to try on or buy our excellent Mule-Dev-202 training guide.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q59-Q64):

NEW QUESTION # 59

AnyAirlines needs to automatically sync Salesforce accounts with NetSuite customers using a MuleSoft Composer flow. The Address field in the Salesforce Account object is a compound field consisting of the simple fields: Street, City, State, Zip, and Country.

However, the Address field in the NetSuite Customer entity is a list consisting of the simple fields: Street, City, State, Zip, and Country.

Which task must be performed to map fields of the Salesforce Address compound field to the corresponding fields of the NetSuite Address list in the flow?

- A. Break up the NetSuite Address list into fields that match Salesforce address-related fields using a custom formula field in NetSuite.
- **B. Combine the Salesforce address-related fields into a list using a custom expression in Composer.**
- C. Combine the Salesforce address-related fields into a list using a custom formula field in Salesforce.
- D. Combine the Salesforce address-related fields into a list using the Get records action in Composer.

Answer: B

Explanation:

To map fields of the Salesforce Address compound field to the corresponding fields of the NetSuite Address list in MuleSoft Composer, you need to perform the following task:

Custom Expression in Composer:

Use a custom expression in MuleSoft Composer to combine the individual address-related fields from Salesforce (Street, City, State, Zip, Country) into a format that matches the NetSuite Address list.

This custom expression will concatenate the individual simple fields from Salesforce into a structured format that can be mapped directly to the NetSuite Address list.

Mapping the Fields:

Once the custom expression is created, map the resulting list to the corresponding fields in the NetSuite Customer entity within the Composer flow.

This ensures that each simple field in the Salesforce compound Address field is correctly mapped to the respective field in the NetSuite Address list.

NEW QUESTION # 60

The MuleSoft development team at Northern Trail Outfitters creates a Mule application that interacts with several APIs and RPA processes. The team needs to share this application with other teams to help them create similar applications.

How should the Mule application be published in Anypoint Exchange to meet this requirement?

- A. Connector asset
- **B. Template asset**
- C. Custom asset
- D. API asset

Answer: B

Explanation:

To share a Mule application that interacts with several APIs and RPA processes with other teams for creating similar applications, publishing it as a Template asset is the best approach:

Template Asset:

A Template in Anypoint Exchange is designed to provide a reusable solution that can be easily adapted for different use cases. It includes predefined integration logic and configurations that can be used as a starting point for new projects.

By publishing the Mule application as a Template, other teams can leverage this pre-built solution, customize it to their specific needs, and ensure consistency in integration practices across the organization.

NEW QUESTION # 61

Northern Trail Outfitters set up a MuleSoft Composer integration between Salesforce and NetSuite that updates the Order object in Salesforce with data from NetSuite.

When an order in Salesforce is updated as complete, the Last Order Date custom field on the related account should automatically update with the date the order was marked complete.

What is the best practice to achieve this outcome?

- A. Create a MuleSoft RPA bot that updates the related account when the order is marked complete.
- B. Update the MuleSoft Composer integration to also update the related account when the order is marked complete.
- **C. Create a record-triggered flow on the Order object that updates the related account when the order is marked complete.**
- D. Replace the MuleSoft Composer integration with a three-tier API integration between Salesforce and NetSuite using Anypoint Platform.

Answer: C

Explanation:

To update the Last Order Date custom field on the related account when an order is marked complete in Salesforce, the best practice is to use a record-triggered flow:

Create a Record-Triggered Flow:

Use Salesforce Flow to create a record-triggered flow on the Order object.

Set the flow to trigger when a record is updated (specifically, when the order status is updated to complete).

Update the Related Account:

In the flow, use a Get Records element to fetch the related Account record.

Use an Update Records element to update the Last Order Date custom field on the related Account with the date the order was marked complete.

This approach ensures that the data remains within Salesforce and is updated immediately as part of the same transaction, providing a robust and efficient solution.

NEW QUESTION # 62

Northern Trail Outfitters evaluates multiple standards for the exit criteria of a stage in their Flow Orchestration. Based on their criteria, they want the flow to go down one of three paths.

How should this be built in Flow Orchestration to meet this requirement?

- A. Create two evaluation flows, and execute the second evaluation flow if the first evaluation flow returns false.
- **B. Have the evaluation flow return a number variable, and use a decision element to determine which path to execute.**
- C. Use the evaluation flow to determine the exit criteria for the current stage. Then, use a separate evaluation flow to determine the entry criteria for each of the three paths.
- D. Evaluate the criteria for the first two paths in an evaluation flow. Then, use the default path functionality of the decision element for the third path.

Answer: B

Explanation:

To implement branching logic based on multiple criteria in Flow Orchestration, you can use the following approach:

Evaluation Flow Returns a Number Variable:

Create an evaluation flow that assesses the exit criteria for the current stage and returns a number variable indicating which path to take (e.g., 1, 2, or 3).

Decision Element:

Use a decision element in Flow Orchestration to evaluate the number variable returned by the evaluation flow.

Based on the value of the variable, the decision element will determine which path to execute next.

This approach allows for clear and maintainable branching logic, ensuring that the flow can proceed down one of three paths based on the defined criteria.

NEW QUESTION # 63

AnyAirlines releases a new REST API that exposes access to an RPA process. The RPA process can only handle a limited number of interactions per second before the API begins returning errors.

Which policy should AnyAirlines apply to prevent the API from being overloaded?

- **A. Spike Control**
- B. Client ID Enforcement
- C. JSON threat protection
- D. Rate Limiting - SLA

Answer: A

Explanation:

To prevent an API from being overloaded, the Spike Control policy is suitable. It helps manage sudden bursts of traffic by limiting the rate at which requests are processed. Here's how it works:

Preventing Overloads:

Spike Control smooths out bursts of incoming requests by enforcing a rate limit over a short period, protecting the backend systems from being overwhelmed by excessive traffic.

Configuration:

Apply the Spike Control policy to the API to define the maximum number of requests allowed within a specific timeframe.

This ensures that the API can handle a limited number of interactions per second, preventing errors due to overload.

Implementation:

In Anypoint Platform, configure the Spike Control policy to the desired thresholds, ensuring the RPA process can handle the load effectively without errors.
