Additionally, the NCP-MCA Certification is recognized by Nutanix, which is a leading provider of cloud-based solutions.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q34-Q39):

NEW QUESTION # 34

When configuring Calm to use Kubernetes as a provider, what two options does an administrator have as Kubernetes types? (Choose two.)

- A. Rancher
- B. Karbon
- C. Vanilla
- D. OpenShift

Answer: B,C

Explanation:

When configuring Calm to use Kubernetes as a provider, the administrator can choose between two Kubernetes types: Karbon and Vanilla. Karbon is Nutanix's own Kubernetes distribution that is integrated with Prism and AHV. Vanilla is any other Kubernetes distribution that is not Karbon, such as OpenShift, Rancher, or EKS. The administrator needs to provide the Kubernetes API endpoint and credentials for the Vanilla type, while the Karbon type is automatically discovered by Calm. Reference: Nutanix Certified Professional - Multicloud Automation (NCP-MCA) Exam Blueprint Guide, page 14; Nutanix NCP-MCA Questions, question 102.

NEW QUESTION # 35

What is an optional field when creating a Runbook?

- A. Default Endpoint
- B. Name
- C. Project
- D. Task Name

Answer: A

Explanation:

When creating a Runbook in Nutanix Calm, the "Default Endpoint" field is optional. Essential fields such as Name, Project, and Task Name are required to define the Runbook's structure and execution parameters. The Default Endpoint can be specified if there is a preferred initial endpoint for executing tasks, but it is not mandatory.

References:

- * Nutanix Calm documentation on Runbook Creation.

NEW QUESTION # 36

What should be done to scale out an existing Calm environment?

- A. Back up the data and create three Calm VMS from the Calm VM OVA template.
- B. Create new prism Central Scale-Out VMS and enable Calm within the GUI.
- C. Back up the data and create three Calm VMS from the Calm VM QCOW2 image.
- D. Run cluster destroy on the VM that will be the master Calm VM.

Answer: A

Explanation:

According to the Nutanix Calm documentation¹, to scale out an existing Calm environment, the administrator needs to back up the data and create three Calm VMs from the Calm VM OVA template. The administrator then needs to configure the Calm VMs as a cluster and restore the data from the backup. The other options are incorrect because they either do not use the correct image format, do not create a cluster of Calm VMs, or destroy the existing Calm VM. References:

NEW QUESTION # 37

Save Playbook

Given input is invalid. No existing secret params found. password cannot XXXXXXXX have value.

An administrator is receiving the error shown in the exhibit while saving the Playbook.

What is causing this issue?

- A. Password Policy does not match for the given password.
- **B. The Playbook is cloned from another playbook with a password.**
- C. There are no saved credentials found in the Playbook.
- D. The given credentials do not have the access for execution.

Answer: B

Explanation:

The error message indicates that the password parameter is not a secret parameter, which means it is not encrypted and stored securely in the Calm database. This can happen when a Playbook is cloned from another Playbook that has a password parameter defined as a secret parameter. The cloned Playbook will inherit the password value from the original Playbook, but it will not be a secret parameter. To resolve this issue, the administrator needs to either delete the password parameter and create a new one as a secret parameter, or edit the password parameter and mark it as a secret parameter. NEW QUESTION # 38

A director would like to have an up to date Cluster Efficiency Summary report emailed on the first of every month to keep management up to date on how the cluster is being utilized.

How could a playbook be configured to satisfy this request with the least human interaction?

- A. Report Trigger > Wait Until Day of Month > Email
- **B. Time Trigger > Generate Report > Email**
- C. Manual Trigger > Wait Until Day of Month > Generate Report > Email
- D. Manual Trigger > Generate Report > Email

Answer: B

Explanation:

A time trigger is a type of playbook trigger that allows the user to specify a schedule for running a playbook.

This trigger is useful for automating tasks that need to be performed periodically or at a specific time. A manual trigger requires the user to initiate the playbook execution manually, which is not ideal for a recurring task. A report trigger is a type of playbook trigger that allows the user to run a playbook when a specific report is generated. However, this trigger does not guarantee that the report will be generated on the first of every month, as it depends on the report settings. A wait until day of month action is a type of playbook action that pauses the playbook execution until a specified day of the month. This action is unnecessary if the playbook already has a time trigger that specifies the desired schedule.
