Snowflake SnowPro Advanced: Data Analyst Certification Exam Sample Questions (Q23-Q28):

NEW QUESTION # 23

You are tasked with building a report to analyze customer churn. The data includes customer demographics, purchase history, website activity, and support interactions. You want to provide interactive filtering capabilities within the report, allowing users to explore the data based on various criteria'. Which Snowflake feature(s) offer the most effective way to implement interactive filtering within your reporting solution without directly exposing underlying tables?

- A. Using Snowflake's external functions to call a custom API that handles filtering logic.
- **B. Creating secure views and stored procedures, then implementing parameterized queries within the reporting tool that call the stored procedures with user-defined parameters.**
- C. Creating static reports using a scheduling tool to generate PDFs.
- D. Using Snowflake's Data Marketplace to directly share the raw tables with the reporting tool.
- E. Granting direct read access to all the underlying tables to the reporting tool's service account.

Answer: B

Explanation:

Secure views and stored procedures (option B) provide a controlled interface for accessing the data. Secure Views protect the underlying schema. Stored procedures encapsulate the filtering logic and can validate the provided parameters. This is crucial for both security and data governance. Other options are either insecure (A, D) or don't provide interactive filtering (E). While external functions could potentially work, they add unnecessary complexity compared to stored procedures.

NEW QUESTION # 24

You're working with a large dataset containing website user activity, including 'session_id', 'user_id', 'timestamp', and 'page_view'. You suspect bot activity is skewing your engagement metrics. Bots tend to have very short session durations and high page view counts within those sessions. Which of the following Snowflake SQL queries, used in combination, would be MOST effective in identifying and flagging potential bot sessions, considering performance on a large dataset? Assume you have access to Snowflake's statistical functions.

- A.
- B.
- C.
- D.
- E.

Answer: A

Explanation:

Option E is most effective because it identifies bot sessions based on two distinct criteria: unusually high page view counts AND unusually short session durations, which are characteristic of bots. By combining these two conditions with standard deviations, it reduces the likelihood of false positives. All other answer choices only check rate and not the count or session duration .

NEW QUESTION # 25

You are tasked with cleaning and transforming a dataset containing customer information in Snowflake. This dataset includes columns such as 'CUSTOMER ID', 'NAME', 'EMAIL', 'PHONE NUMBER', and 'ADDRESS'. Your goal is to implement several data quality rules: 1) Ensure all phone numbers are in a consistent '+1-XXX-XXX-XXXX' format (where X is a digit). 2) Remove any leading or trailing whitespace from the 'NAME' and 'ADDRESS' columns. 3) Replace invalid email addresses (identified by failing a specific regex pattern) with NULL. Which combination of Snowflake SQL statements would efficiently and accurately address these requirements?

- A.
- B.
- C.
- D.
- E.

Answer: D

Explanation:

Option D correctly addresses all requirements by performing all transformations within a single CREATE OR REPLACE TABLE statement. This ensures atomicity and avoids multiple update operations. It correctly trims NAME and ADDRESS, replaces invalid emails with NULL, and formats phone numbers if they have exactly 10 digits after removing non-numeric characters, otherwise assigning NULL. The correct option must format phone number as well as replace with NULL, while not replacing with NULL would mean keep original. Option E keeps original value not NULL, if phone number doesn't match criteria.

NEW QUESTION # 26

Which action aids in performing a diagnostic analysis on historical data to identify reasons/causes of anomalies?

- A. Ignoring statistical trends in historical data
- B. Collecting related data and demographics
- C. Focusing on isolated data points
- D. Analyzing data solely from the past month

Answer: B

Explanation:

Collecting related data and demographics is crucial in understanding the reasons/causes of anomalies in historical data.

NEW QUESTION # 27

How does understanding and analyzing the query execution plan contribute to query optimization in Snowflake?

- A. Restricts access to query results
- B. Helps in generating real-time data updates
- C. Aids in understanding query processing steps and bottlenecks
- D. Facilitates identifying hardware limitations

Answer: C

Explanation:

Analyzing the query execution plan assists in understanding query processing steps, identifying bottlenecks, and optimizing query performance by streamlining execution steps.
