CrowdStrike Certified Cloud Specialist Sample Questions (Q265-Q270):

NEW QUESTION # 265
Which of the following best describes assessed/unassessed items within Falcon Cloud Security?

- A. Assessed items are container images that have undergone vulnerability analysis, while unassessed items are images that

- B. Assessed items pertain to container images used in production, while unassessed items are deprecated images stored in registries.
- C. Assessed items are configurations actively updated by CrowdStrike, and unassessed items are configurations maintained by third-party services.
- D. Assessed items include accounts and containers currently monitored, whereas unassessed items are external accounts or containers.

Answer: A

Explanation:
Option A: This is the correct definition of assessed/unassessed items. Assessed items are container images scanned for vulnerabilities, providing actionable insights for security teams.
Unassessed items have not yet been analyzed, potentially leaving blind spots in security assessments.
Option B: This answer assumes assessed/unassessed relates to image usage in production versus storage, which is not accurate. The distinction centers on whether vulnerability scanning has occurred, irrespective of deployment status.
Option C: This mixes up assessed/unassessed items with managed/unmanaged accounts or containers. The terminology applies to container images, not accounts or containers monitored by CrowdStrike.
Option D: The configuration management described here pertains to policy control, which is unrelated to the assessed/unassessed classification of container images.

NEW QUESTION # 266
Using CrowdStrike CIEM/Identity Analyzer, which of the following indicates an account that uses MFA?

- A. An account that prompts users to enter a code sent to their email in addition to their password.
- B. An account that uses only an SSH key pair for authentication.
- C. An account with no configured security policy for additional authentication factors.
- D. An account that requires a username and password to log in.

Answer: A

Explanation:
Option A: Accounts without an additional authentication factor clearly do not use MFA. This scenario indicates a lack of proper security policies.
Option B: SSH key pairs are a single-factor authentication mechanism based on "something you have." While secure, this does not qualify as MFA unless combined with an additional factor, such as a password or OTP.
Option C: Multi-Factor Authentication (MFA) requires at least two forms of authentication, typically combining something the user knows (password) and something they have (email code, authenticator app). This example clearly demonstrates the use of MFA by requiring an additional code after password entry.
Option D: A username and password alone constitute single-factor authentication. While secure passwords are important, they do not meet the criteria for MFA.

NEW QUESTION # 267
What is the most efficient way to detect rogue containers and identify drift in containerized workloads in a cloud environment?

- A. Utilizing Falcon Discover to perform agentless scanning for rogue containers.
- B. Configuring Falcon CWP to monitor container lifecycle and detect drift.
- C. Using Falcon Horizon to audit Kubernetes configurations.
- D. Deploying manual container inspection scripts to identify runtime anomalies.

Answer: B

Explanation:
Option A: Falcon Discover provides visibility into assets and cloud workloads, but it does not offer runtime monitoring or drift detection capabilities. It is useful for inventory purposes, not runtime protection.
Option B: Falcon Horizon focuses on misconfiguration detection and compliance for Kubernetes and other cloud platforms. While it can identify misconfigurations that might lead to rogue containers, it does not monitor runtime behaviors or detect drift.
Option C: Falcon Cloud Workload Protection (CWP) is specifically designed to monitor containerized workloads in real time, detect rogue containers, and identify drift from expected configurations. Drift detection ensures that workloads adhere to defined

security baselines, while runtime protection addresses rogue or unauthorized containers. This approach is automated and efficient.
Option D: Manual inspection scripts are labor-intensive and not scalable for dynamic containerized environments. They lack the automation and real-time capabilities provided by Falcon CWP.

NEW QUESTION # 268
After performing an image assessment in Falcon Cloud Security, which of the following is a typical actionable recommendation?

- **A. Update container images to address identified critical vulnerabilities.**
- B. Apply a pod security policy to restrict privileged containers.
- C. Disable unused Kubernetes Admission Controllers.
- D. Limit the number of pods per node to prevent resource exhaustion.

Answer: A

Explanation:
Option A: Admission Controllers provide security and compliance enforcement, and disabling them would reduce security posture rather than align with image assessment results.
Option B: Applying pod security policies is a general security best practice but is not directly derived from an image assessment.
Option C: Image assessments identify vulnerabilities and provide actionable recommendations, such as updating base images or dependencies to mitigate critical security risks.
Option D: Limiting pods per node is a capacity management measure, not an outcome of image assessments focused on vulnerabilities.

NEW QUESTION # 269
What is the primary benefit of using automated remediation in a cloud security workflow?

- A. Ensuring compliance with industry regulations without manual checks
- B. Increasing cloud environment performance by optimizing resource utilization
- C. Eliminating the need for human oversight during incident response
- **D. Reducing response time by taking immediate action on detected threats**

Answer: D

Explanation:
Option A: Automated remediation complements, but does not replace, human oversight. Security teams still need to review actions, analyze complex incidents, and refine policies to ensure proper functionality.
Option B: While automated remediation can support compliance by addressing security gaps promptly, it does not fully replace manual checks, audits, or detailed compliance reviews.
Option C: Automated remediation is focused on security incident response, not resource optimization. While securing the environment may have indirect performance benefits, this is not the primary goal.
Option D: The primary advantage of automated remediation is its ability to act quickly and mitigate threats as soon as they are detected, significantly reducing response time. This minimizes the potential impact of threats by containing them before they can escalate or cause further damage.
