The PeopleCert DevOps Site Reliability Engineer (SRE) certification exam covers a wide range of topics, including automation, monitoring, incident response, disaster recovery, and performance optimization. It also tests the candidate's understanding of various tools and technologies commonly used in site reliability engineering, such as Kubernetes, Docker, Ansible, and Prometheus. DevOps-SRE Exam is designed to be challenging and comprehensive, ensuring that certified professionals have a deep understanding of the subject matter and are well-equipped to handle the demands of the role.

Peoplecert PeopleCert DevOps Site Reliability Engineer (SRE) Sample Questions (Q62-Q67):

NEW QUESTION # 62

Which of the following BEST describes the capabilities and scope of DevOps continuous monitoring?

- A. The use of multiple monitoring tools and an event management process for all applications
- B. The application of widespread system event monitoring by automating the end user transactions
- C. The deployment of a set of integrated monitoring tools and event thresholds for infrastructure
- D. The combination of tools and the process for a rapid incident detection and response of cloud services

Answer: C

NEW QUESTION # 63

Which of the following BEST describes an advantage of a container-based structure?

- A. The portability created by containers enables software to run independently of the host operating system
- B. The security of applications in containers is simplified because they share the security of the host system
- C. Software runs much more efficiently in containers because of the ability to run on virtual machines
- D. The lightweight nature of containers requires fewer developers to actually create the software code

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Containers provide a major advantage that aligns with SRE: portability and environment consistency. The SRE Workbook describes containers as: "lightweight, portable units that encapsulate applications and dependencies, ensuring consistent behavior across environments." This independence from the host OS environment enables predictable deployments and simplifies automation, scaling, and orchestration- especially when used with Kubernetes.

Option A captures this exact benefit: portability and independence from the host OS.

Option B is incorrect-containers do not reduce the number of developers required.

Option C incorrectly claims that efficiency comes from virtual machines; containers are typically more efficient because they avoid VM overhead, not leverage it.

Option D is incorrect-containers do not "inherit" security automatically; in fact, they require additional security controls.

Thus, A is the correct answer.

NEW QUESTION # 64

Which of the following is the BEST example of an SRE team that embraces full-service ownership?

- A. The team is responsible for the coding and improvement of the application.
- B. The team is responsible for application performance and reliability aspects.
- C. The team is accountable for coding, shipping, and improving the application.
- D. The team is accountable for the application development and performance.

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In SRE practice, "full-service ownership" means the same team is responsible for the service across its entire lifecycle: design, development, deployment, operation, and continuous improvement. Google's Site Reliability Engineering: How Google Runs Production Systems describes SRE as a software-engineering- focused approach to operations, where engineers are responsible not only for writing the code but also for running it in production and improving its reliability over time. This aligns with the "you build it, you run it" model, which removes the traditional wall between development and operations and makes one team accountable for the whole service.

Option D - "The team is accountable for coding, shipping, and improving the application" - best matches this concept because it explicitly includes building (coding), releasing (shipping), and iterating (improving).

Options A and B do not clearly include operational responsibility, and option C narrows the focus only to performance and reliability, omitting ownership of development and releases. Therefore, D most accurately reflects full-service ownership as described in SRE literature.

NEW QUESTION # 65

Which of the following is the MOST accurate description of Kubernetes?

- A. An independent platform that enables organizations to implement continuous integration and delivery practices
- B. A proprietary system developed to automate the integration, building, testing and deployment of application containers
- C. A platform used to manage containers in a cloud environment and also includes automated scaling and failover
- D. An open-source operating system on which containerized applications can be run monitored and managed efficiently

Answer: C

NEW QUESTION # 66

Identify the missing word(s) in the following sentence:

Site reliability engineering is a _____ approach to IT operations.

- A. simulation engineering
- B. security engineering
- C. software engineering
- D. structural engineering

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Google's SRE definition is explicit: "Site Reliability Engineering is what happens when you ask a software engineer to design an operations team." (SRE Book - Introduction). This clearly defines SRE as a software engineering approach applied to operational problems. The goal is to use software techniques-automation, coding, testing, version control, CI/CD, observability-to improve reliability and reduce toil. The book emphasizes: "SRE applies software engineering to operations work." (SRE Book - What Is SRE?).

Option C is the only answer fully aligned with the official definition.

Options A, B, and D do not correspond to the SRE definition provided by Google.

Thus, the correct missing phrase is software engineering.
