Huawei HCSP-Presales-Campus Network Planning and Design V2.0 Sample Questions (Q21-Q26):

NEW QUESTION # 21

Which of the following deployment modes are supported by APs?

- A. Email-based deployment
- B. DHCP Option 148-based deployment
- C. Barcode scanning-based deployment with CloudCampus APP
- D. Registration query center-based deployment

Answer: B,C,D

Explanation:

In the Xinghe Intelligent Campus solution, APs (Access Points) support several automated "Plug-and-Play" deployment methods. Option A (Registration Query Center) allows an AP to query a Huawei-hosted global database to find its assigned controller. Option C (Barcode Scanning) uses the mobile app to scan the SN (Serial Number), binding the device to a site. Option D (DHCP Option 148) allows a local DHCP server to deliver the management IP of iMaster NCE-Campus directly to the AP. Email-based deployment (B) is reserved specifically for AR routers/CPEs in SD-WAN scenarios and is not a supported method for AP onboarding.

NEW QUESTION # 22

Which of the following information is contained in the DHCP snooping binding table?

- A. Interface
- B. VLAN
- C. MAC address
- D. IP address

Answer: A,B,C,D

Explanation:

DHCP Snooping is a key security feature in campus access layer design. When a client obtains an IP address, the switch populates a binding table that links the MAC address (B) and the assigned IP address (D) to the specific physical Interface (C) and the VLAN (A) ID. This table is then used by other security features like Dynamic ARP Inspection (DAI) and IP Source Guard (IPSG) to prevent spoofing attacks by verifying that incoming traffic matches the authorized entries in the binding table.

NEW QUESTION # 23

Free mobility grants users consistent network access rights and enforces corresponding policies, regardless of the users' locations and IP addresses.

- A. False
- B. True

Answer: B

Explanation:

Free Mobility is a core component of the Huawei Xinghe Intelligent Campus solution. Traditionally, network policies (ACLs) were tied to IP addresses, which change as users move. Free Mobility decouples policies from IP addresses by using Security Groups (also known as "Group-based Policy"). When a user authenticates via iMaster NCE-Campus, they are assigned to a specific group. The network then enforces permissions based on the "Source Group" and "Destination Group," ensuring that a teacher, for example, has the same access rights whether they are in the office, a classroom, or the library.

NEW QUESTION # 24

Which of the following components in Huawei's ESN-free deployment solution generates the SiteCode?

- A. Core switch
- B. iMaster NCE cloud management platform
- C. AP
- D. Egress gateway

Answer: B

Explanation:

In the Xinghe Intelligent Campus ESN-free deployment (aimed at simplifying logistics where the Serial Number/ESN isn't known beforehand), the iMaster NCE-Campus (D) platform generates a unique SiteCode. This SiteCode is provided to the installation personnel, who then enter it into the deployment app or the device's local web UI. Once the device connects to the internet, it reports the SiteCode to the platform, which then automatically binds the device's ESN to the correct site configuration.

NEW QUESTION # 25

What is the single-link failover time supported by Huawei's M-LAG solution?

- A. < 2s
- B. < 1s
- C. < 50 ms
- D. < 400 ms

Answer: C

Explanation:

M-LAG (Multichassis Link Aggregation Group) is a key reliability technology in the Huawei Xinghe Intelligent Campus architecture. It provides device-level redundancy by virtualizing two switches into a single logical entity. One of the primary performance requirements for M-LAG in high-availability designs is ensuring millisecond-level failover. In the event of a single link failure (e.g., an uplink from an access switch to one of the M-LAG core switches), the traffic is rerouted through the peer-link or the remaining active member of the Eth-Trunk in less than 50 ms, ensuring "hitless" service for sensitive applications like voice or industrial control.
