Pass Identity-and-Access-Management-Architect Exam with High-quality Reliable Identity-and-Access-Management-Architect Test Dumps by PrepPDF

By seeing your goofs you can work on your show continually for the Salesforce Identity-and-Access-Management-Architect approach. You can give vast phony tests to make them ideal for Salesforce Identity-and-Access-Management-Architect and can check their past given exams. Salesforce Identity-and-Access-Management-Architect Dumps will give reliable free updates to our clients generally all the Salesforce Certified Identity and Access Management Architect.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q212-Q217):

NEW QUESTION # 212

A global company's Salesforce Identity Architect is reviewing its Salesforce production org login history and is seeing some intermittent Security Assertion Markup Language (SAML SSO) 'Replay Detected and Assertion Invalid' login errors.

Which two issues would cause these errors?

Choose 2 answers

- **A. The subject element is missing from the assertion sent to salesforce.**
- B. The current time setting of the company's identity provider (IdP) and Salesforce platform is out of sync by more than eight minutes.
- C. The certificate loaded into SSO configuration does not match the certificate used by the IdP.
- **D. The assertion sent to Salesforce contains an assertion ID previously used.**

Answer: A,D

NEW QUESTION # 213

A web service is developed that allows secure access to customer order status on the Salesforce Platform. The service connects to Salesforce through a connected app with the web server flow. The following are the required actions for the authorization flow:

1. User Authenticates and Authorizes Access
2. Request an Access Token
3. Salesforce Grantsan Access Token
4. Request an Authorization Code
5. Salesforce Grants Authorization Code

What is the correct sequence for the authorization flow?

- A. 2, 1, 3, 4, 5
- **B. 4, 1, 5, 2, 3**
- C. 1, 4, 5, 2, 3
- D. 4,5,2, 3, 1

Answer: B

Explanation:

The web server flow is an OAuth2.0 authorization code grant type, which follows this sequence of steps:

- * The client app requests an authorization code from Salesforce by redirecting the user to the authorization endpoint.
- * The user authenticates and authorizes access to the client app.
- * Salesforce grants an authorization code and redirects the user back to the client app.
- * The client app requests an access token from Salesforce by sending the authorization code to the token endpoint.
- * Salesforce grants an access token and a refresh token to the client app.

NEW QUESTION # 214

Universal Containers (UC) wants its closed Won opportunities to be synced to a Data Warehouse in near real time. UC has implemented Outbound Message to enable near real-time data sync. UC wants to ensure that communication between Salesforce and Target System is Secure. What Certificate is sent along with the Outbound Message?

- A. The CA-Signed Certificate from the Certificate and Key Management menu.
- B. The Self-Signed Certificates from the Certificate & Key Management menu.
- C. The default Client Certificate from the Develop--> API Menu.
- D. The default Client Certificate or a Certificate from Certificate and Key Management menu.

Answer: A

Explanation:

The CA-Signed Certificate from the Certificate and Key Management menu is the certificate that is sent along with the outbound message. An outbound message is a SOAP message that is sent from Salesforce to an external endpoint when a workflow rule or approval process is triggered. To ensure that the communication between Salesforce and the target system is secure, the outbound message can be signed with a certificate that is generated or uploaded in the Certificate and Key Management menu. The certificate must be CA-Signed, which means that it is issued by a trusted certificate authority (CA) that verifies the identity of the sender. The other options are not valid certificates for this purpose. The default client certificate from the Develop--> API Menu is a self-signed certificate that is used for testing purposes only and does not provide adequate security.

The default client certificate or a certificate from Certificate and Key Management menu is too vague and does not specify whether the certificate is CA-Signed or self-signed. The self-signed certificates from the Certificate & Key Management menu are certificates that are generated by Salesforce without any verification by a CA, and they are not recommended for production use.

NEW QUESTION # 215

A company's external application is protected by Salesforce through OAuth. The identity architect for the project needs to limit the level of access to the data of the protected resource in a flexible way.

What should be done to improve security?

- A. Define a permission set that grants access to the app and assign to authorized users.
- B. Select "Admin approved users are pre-authorized" and assign specific profiles.
- C. Create custom scopes and assign to the connected app.
- D. Leverage external objects and data classification policies.

Answer: C

Explanation:

To limit the level of access to the data of the protected resource in a flexible way, the identity architect should create custom scopes and assign them to the connected app. Custom scopes are permissions that define the specific data that an external application can access or modify in Salesforce. Custom scopes can be created using Apex or Metadata API and assigned to a connected app using OAuth 2.0 or SAML protocols. Custom scopes can provide more granular control over data access than standard scopes, which are predefined by Salesforce. References: Custom Scopes, Create and Assign Custom Scopes

NEW QUESTION # 216

Universal Containers (UC) is building a custom employee hut) application on Amazon Web Services (AWS) and would like to store their users' credentials there. Users will also need access to Salesforce for internal operations. UC has tasked an identity architect with evaluating different solutions for authentication and authorization between AWS and Salesforce.

How should an identity architect configure AWS to authenticate and authorize Salesforce users?

- A. Configure the custom employee app as a connected app.
- B. Configure AWS as an OpenID Connect Provider.
- C. Develop a custom Auth server in AWS.
- D. Create a custom external authentication provider.

Answer: B

Explanation:

To authenticate and authorize Salesforce users with AWS, the identity architect should configure AWS as an OpenID Connect Provider. OpenID Connect is a protocol that allows users to sign in with an external identity provider, such as AWS, and access Salesforce resources. To enable this, the identity architect needs to configure an OpenID Connect Authentication Provider in Salesforce and link it to a connected app. The other options are not relevant for this scenario. References: OpenID Connect Authentication Providers, Social Sign-On with OpenID Connect

NEW QUESTION # 217

.....

A certificate may be a threshold for many corporations, it can decide that if you can enter a good company. There are Identity-and-Access-Management-Architect test dumps in our company with high quality, if you choose us pass guarantee and money back guarantee, if you indeed fail the exam, your money will be returned to your account.
