Our Workday-Pro-Integrations test guide has become more and more popular in the world. Of course, if you decide to buy our Workday-Pro-Integrations latest question, we can make sure that it will be very easy for you to pass your exam and get the certification in a short time, first, you just need 5-10 minutes can receive Workday-Pro-Integrations Exam Torrent that you can learn and practice it. Then you just need 20-30 hours to practice our study materials that you can attend your exam. It is really spend your little time and energy.

Workday Workday-Pro-Integrations Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">XSLT: This section of the exam measures the skills of Data Integration Developers and covers the use of Extensible Stylesheet Language Transformations (XSLT) in Workday integrations. It focuses on transforming XML data structures, applying conditional logic, and formatting output for various integration use cases such as APIs and external file delivery.

Topic 2	<ul style="list-style-type: none"> • Cloud Connect: This section of the exam measures the skills of Workday Implementation Consultants and focuses on using Workday Cloud Connect solutions for third-party integration. It includes understanding pre-built connectors, configuration settings, and how to manage data flow between Workday and external systems while ensuring security and data integrity.
Topic 3	<ul style="list-style-type: none"> • Calculated Fields: This section of the exam measures the skills of Workday Integration Analysts and covers the creation, configuration, and management of calculated fields used to transform, manipulate, and format data in Workday integrations. It evaluates understanding of field types, dependencies, and logical operations that enable dynamic data customization within integration workflows.
Topic 4	<ul style="list-style-type: none"> • Enterprise Interface Builders: This section of the exam measures the skills of Integration Developers and covers the use of Workday's Enterprise Interface Builder (EIB) to design, deploy, and maintain inbound and outbound integrations. It evaluates the candidate's ability to create templates, configure transformation rules, schedule integrations, and troubleshoot EIB workflows efficiently.

Professional Workday-Pro-Integrations Reliable Exam Braindumps and Authorized Workday-Pro-Integrations Latest Real Exam & New Workday Pro Integrations Certification Exam Guaranteed Questions Answers

Our company is professional brand. There are a lot of experts and professors in the field in our company. All the experts in our company are devoting all of their time to design the best Workday-Pro-Integrations Workday-Pro-Integrations study materials for all people. In order to ensure quality of the products, a lot of experts keep themselves working day and night. We believe that our study materials will have the ability to help all people pass their Workday-Pro-Integrations Exam and get the related exam in the near future.

Workday Pro Integrations Certification Exam Sample Questions (Q77-Q82):

NEW QUESTION # 77

Refer to the following scenario to answer the question below.

You are implementing a Core Connector: Worker integration to send employee data to a third-party active employee directory. The external vendor requires the following:

The Employee's Active Directory User Principal Name.

A mapping from Worker Type values to external worker type codes.

A specific filename format that includes a timestamp and sequence number.

You also need to ensure the document transformation occurs before the file is delivered to the endpoint. The connector's output must be transformed before the file is delivered to the vendor.

What step must be taken to ensure this occurs correctly?

- A. Configure the business process to run the Document Delivery Service before the Document Transformation step.
- B. Schedule the Document Transformation connector in a separate integration system from the business process delivery step.
- C. Schedule the Document Transformation connector to run after the Core Connector: Worker completes.
- **D. Configure the business process to run the Document Transformation step before the Document Delivery Service step.**

Answer: D

Explanation:

The requirement states that the connector output must be transformed before the file is delivered to the endpoint. This means the Document Transformation step must run first, followed by the Document Delivery step.

In Workday, this is managed through the Business Process (BP) attached to the integration system.

From Workday documentation:

"To transform an integration file before delivery, configure the Business Process to run the Document Transformation step before the Document Delivery Service step." This ensures that:

The file is converted (via XSLT) to the correct format (e.g., CSV or flat XML) Only the final, transformed file is sent to the endpoint

Why the others are incorrect:

A . Scheduling separately does not ensure correct sequence.

- B . Delivery before transformation would send the wrong file.
- D . A separate integration system is unnecessary and not best practice for chained transformations.

NEW QUESTION # 78

Refer to the following scenario to answer the question below.

You have been asked to build an integration using the Core Connector: Worker template and should leverage the Data Initialization Service (DIS). The integration will be used to export a full file (no change detection) for employees only and will include personal data.

What configuration is required to output the value of a calculated field which you created for inclusion in this integration?

- **A. Configure Integration Field Overrides.**
- B. Configure Integration Field Attributes.
- C. Configure Integration Attributes.
- D. Configure Integration Maps.

Answer: A

Explanation:

The scenario involves a Core Connector: Worker integration using the Data Initialization Service (DIS) to export a full file of employee personal data, with a requirement to include a calculated field in the output.

Core Connectors rely on predefined field mappings, but custom calculated fields need specific configuration to be included. Let's analyze the solution:

* Requirement: Output the value of a calculated field created for this integration. In Workday, calculated fields are custom-built (e.g., using Report Writer or Calculated Fields) and not part of the standard Core Connector template, so they must be explicitly added to the output.

* Integration Field Overrides: In Core Connectors, Integration Field Overrides allow you to replace a delivered field's value or add a new field to the output by mapping it to a calculated field. This is the standard method to include custom calculated fields in the integration file. You create the calculated field separately, then use overrides to specify where its value appears in the output structure (e.g., as a new column or replacing an existing field).

* Option Analysis:

* A. Configure Integration Field Attributes: Incorrect. Integration Field Attributes refine how delivered fields are output (e.g., filtering multi-instance data like phone type), but they don't support adding or mapping calculated fields.

* B. Configure Integration Field Overrides: Correct. This configuration maps the calculated field to the output, ensuring its value is included in the exported file.

* C. Configure Integration Attributes: Incorrect. Integration Attributes define integration-level settings (e.g., file name, delivery protocol), not field-specific outputs like calculated fields.

* D. Configure Integration Maps: Incorrect. Integration Maps transform existing field values (e.g., "Married" to "M"), but they don't add new fields or directly output calculated fields.

* Implementation:

* Create the calculated field in Workday (e.g., via Create Calculated Field task).

* Edit the Core Connector: Worker integration.

* Navigate to the Integration Field Overrides section.

* Add a new override, selecting the calculated field and specifying its output position (e.g., a new field ID or overriding an existing one).

* Test the integration to confirm the calculated field value appears in the output file.

References from Workday Pro Integrations Study Guide:

* Core Connectors & Document Transformation: Section on "Configuring Integration Field Overrides" explains how to include calculated fields in Core Connector outputs.

* Integration System Fundamentals: Notes the use of overrides for custom data in predefined integration templates.

NEW QUESTION # 79

What is the task used to upload a new XSLT file for a pre-existing document transformation integration system?

- **A. Edit XSLT Attachment Transformation**
- B. Edit Integration Attachment Service
- C. Edit Integration Attachment
- D. Edit Integration Service Attachment

Answer: A

NEW QUESTION # 80

You have configured a filename sequence generator for a connector integration. The vendor decides that a unique filename is no longer required.

How would you modify the integration to meet this requirement?

- A. Define a static filename with XSLT.
- B. Run the task Delete ID Definition/Sequence Generator.
- **C. Adjust the connector's filename launch parameter.**
- D. Disable the filename sequence generator service.

Answer: C

Explanation:

Key Points:

The correct approach is adjusting the connector's filename launch parameter, which allows setting a static filename and meeting the vendor's requirement of no longer needing unique filenames.

This method ensures that the filename sequence generator is bypassed without disrupting the integration process.

Comprehensive Detailed

In Workday Pro Integrations, filename sequence generators are commonly used to generate unique filenames to avoid overwrites in integrations. However, when a vendor no longer requires unique filenames, modifications must be made to use a fixed filename instead.

Why Option D?

Adjusting the connector's filename launch parameter lets you set a static filename at runtime, effectively overriding any sequence generator settings.

Unlike deleting the sequence generator (which could cause errors), this method ensures smooth execution of the integration with a fixed filename.

This aligns with Workday's best practices for integration configurations, particularly in External Integration Business (EIB) and other Workday connector integrations.

Steps to Implement:

Access the integration's configuration in Workday.

Locate the filename launch parameter for the connector.

Set it to a static value (e.g., "data.txt") to ensure consistent naming.

Supporting Documentation:

Workday documentation on integration configurations, particularly for EIB systems, confirms that filename settings can be adjusted via launch parameters.

The "Get_Sequence_Generators Operation Details" in Workday API documentation supports modifying filename configurations through launch parameters.

NEW QUESTION # 81

Refer to the following scenario to answer the question below.

You have been asked to build an integration using the Core Connector: Worker template and should leverage the Data Initialization Service (DIS). The integration will be used to export a full file (no change detection) for employees only and will include personal data.

What configuration is required to output the value of a calculated field which you created for inclusion in this integration?

- **A. Configure Integration Field Overrides.**
- B. Configure Integration Field Attributes.
- C. Configure Integration Attributes.
- D. Configure Integration Maps.

Answer: A

Explanation:

The scenario involves a Core Connector: Worker integration using the Data Initialization Service (DIS) to export a full file of employee personal data, with a requirement to include a calculated field in the output.

Core Connectors rely on predefined field mappings, but custom calculated fields need specific configuration to be included. Let's analyze the solution:

* Requirement: Output the value of a calculated field created for this integration. In Workday, calculated fields are custom-built (e.g.,

using Report Writer or Calculated Fields) and not part of the standard Core Connector template, so they must be explicitly added to the output.

* **Integration Field Overrides:** In Core Connectors, Integration Field Overrides allow you to replace a delivered field's value or add a new field to the output by mapping it to a calculated field. This is the standard method to include custom calculated fields in the integration file. You create the calculated field separately, then use overrides to specify where its value appears in the output structure (e.g., as a new column or replacing an existing field).

* **Option Analysis:**

* **A. Configure Integration Field Attributes:** Incorrect. Integration Field Attributes refine how delivered fields are output (e.g., filtering multi-instance data like phone type), but they don't support adding or mapping calculated fields.

* **B. Configure Integration Field Overrides:** Correct. This configuration maps the calculated field to the output, ensuring its value is included in the exported file.

* **C. Configure Integration Attributes:** Incorrect. Integration Attributes define integration-level settings (e.g., file name, delivery protocol), not field-specific outputs like calculated fields.

* **D. Configure Integration Maps:** Incorrect. Integration Maps transform existing field values (e.g., "Married" to "M"), but they don't add new fields or directly output calculated fields.

* **Implementation:**

* Create the calculated field in Workday (e.g., via Create Calculated Field task).

* Edit the Core Connector: Worker integration.

* Navigate to the Integration Field Overrides section.

* Add a new override, selecting the calculated field and specifying its output position (e.g., a new field ID or overriding an existing one).

* Test the integration to confirm the calculated field value appears in the output file.
