New AWS-Solutions-Associate Exam Pattern - High AWS-Solutions-Associate Quality

We have a long history of 10 years in designing the AWS-Solutions-Associate exam guide and enjoys a good reputation across the globe. There are so many features to show that our AWS-Solutions-Associate study engine surpasses others. We can confirm that the high quality is the guarantee to your success. At the same time, the prices of our AWS-Solutions-Associate practice materials are quite reasonable for no matter the staffs or the students to afford. What is more, usually we will give some discounts to our worthy customers.

Passing the AWS-Solutions-Associate Certification Exam requires a score of at least 720 out of 1000. Once you pass the exam, you will receive a digital badge and certification that is valid for two years. You will also gain access to exclusive AWS resources, such as training materials, whitepapers, and webinars, that can help you stay up-to-date with the latest AWS technologies and best practices.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q389-Q394):

NEW QUESTION # 389

Amazon RDS supports SOAP only through ____

- A. HTTP
- **B. HTTPS**
- C. TCP/IP
- D. HTTP or HTTPS

Answer: B

NEW QUESTION # 390

A company runs a MySQL database on a single Amazon EC2 instance.

The company needs to improve availability of the database to prepare for power outages.

Which solution will meet this requirement?

- A. Enable termination protection for the EC2 instance.
- B. Configure EC2 automatic instance recovery to move the instance to another Availability Zone.
- **C. Migrate the MySQL database to Amazon RDS and enable Multi-AZ deployment.**
- D. Add an Application Load Balancer (ALB) in front of the EC2 instance.

Answer: C

Explanation:

Amazon RDS Multi-AZ deployment provides automated failover and increased availability for MySQL databases. In case of infrastructure failure or power outage in one Availability Zone, RDS automatically fails over to a standby replica in another AZ, minimizing downtime. This is the AWS-recommended way to achieve high availability for relational databases.

AWS Documentation Extract:

"Amazon RDS Multi-AZ deployments provide high availability, failover support, and data redundancy for database instances. In the event of infrastructure failure, Amazon RDS performs an automatic failover to the standby." (Source: Amazon RDS documentation, High Availability) A: An ALB does not increase availability for a single database instance.

B: EC2 instance recovery does not move the instance across Availability Zones.

D: Termination protection prevents accidental deletion, not availability issues.

NEW QUESTION # 391

A company is moving its data management application to AWS. The company wants to transition to an event-driven architecture.

The architecture needs to be more distributed and to use serverless concepts when performing the different aspects of the workflow.

The company also wants to minimize operational overhead.

Which solution will meet these requirements?

- A. Build out the workflow in AWS Step Functions. Deploy the application on Amazon EC2 instances. Use Step Functions to invoke the workflow steps on the EC2 instances.
- **B. Build out the workflow in AWS Step Functions. Use Step Functions to create a state machine. Use the state machine to invoke AWS Lambda functions to process the workflow steps.**
- C. Build out the workflow in Amazon EventBridge. Use EventBridge to invoke AWS Lambda functions on a schedule to process the workflow steps.
- D. Build out the workflow in AWS Glue. Use AWS Glue to invoke AWS Lambda functions to process the workflow steps.

Answer: B

Explanation:

This answer is correct because it meets the requirements of transitioning to an event-driven architecture, using serverless concepts, and minimizing operational overhead. AWS Step Functions is a serverless service that lets you coordinate multiple AWS services into workflows using state machines. State machines are composed of tasks and transitions that define the logic and order of execution of the workflow steps. AWS Lambda is a serverless function-as-a-service platform that lets you run code without provisioning or managing servers. Lambda functions can be invoked by Step Functions as tasks in a state machine, and can perform different aspects of the data management workflow, such as data ingestion, transformation, validation, and analysis. By using Step Functions and Lambda, the company can benefit from the following advantages:

Event-driven: Step Functions can trigger Lambda functions based on events, such as timers, API calls, or other AWS service events.

Lambda functions can also emit events to other services or state machines, creating an event-driven architecture.

Serverless: Step Functions and Lambda are fully managed by AWS, so the company does not need to provision or manage any servers or infrastructure. The company only pays for the resources consumed by the workflows and functions, and can scale up or down automatically based on demand.

Operational overhead: Step Functions and Lambda simplify the development and deployment of workflows and functions, as they provide built-in features such as monitoring, logging, tracing, error handling, retry logic, and security. The company can focus on the business logic and data processing rather than the operational details.

NEW QUESTION # 392

Can I detach the primary (eth0) network interface when the instance is running or stopped?

- A. Depends on the state of the interface at the time
- B. Yes, You can.
- C. No. You cannot

Answer: C

NEW QUESTION # 393

A company runs an application on Amazon EC2 instances. The instances need to access an Amazon RDS database by using specific credentials. The company uses AWS Secrets Manager to contain the credentials the EC2 instances must use. Which solution will meet this requirement?

- A. Create an IAM user, and attach the user to each EC2 instance profile. Use a resource-based policy to grant the new IAM user access to the secret that contains the database credentials.
- B. Create a resource-based policy for the secret that contains the database credentials. Use EC2 Instance Connect to access the secret.
- C. Create an IAM role, and attach the role to each EC2 instance profile. Use an identity-based policy to grant the new IAM role access to the secret that contains the database credentials.
- D. Create an identity-based policy for the secret that contains the database credentials. Grant direct access to the EC2 instances.

Answer: C

Explanation:

IAM Role: Attaching an IAM role to an EC2 instance profile is a secure way to manage permissions without embedding credentials.

AWS Secrets Manager: Grants controlled access to database credentials and automatically rotates secrets if configured.

Identity-Based Policy: Ensures the IAM role only has access to specific secrets, enhancing security.
