Huawei HCIA-Cloud Computing V5.5 Sample Questions (Q40-Q45):

NEW QUESTION # 40
In Huawei FusionCompute, administrators can discover storage devices by scanning or manually refreshing.

- A. False
- B. True

Answer: A

NEW QUESTION # 41
Which of the following descriptions about the characteristics of virtualization is wrong?

- A. Encapsulation, which encapsulates the virtual machine into a file and saves it on the physical device
- B. Software and hardware are tightly coupled, virtualization depends on the underlying hardware, and compatibility issues need to be considered
- C. Partitioning, the virtualization layer divides resources separately for each virtual machine
- D. Isolation, logical isolation between virtual machines, not affected by each other

Answer: B

NEW QUESTION # 42
In Huawei FusionCompute, it is necessary to modify a certain disk of the virtual machine. Which of the following operations can be realized?

- A. Change the status of the disk from Available to Unavailable
- B. Modify the capacity of the disk from 80GB to 8GB
- C. Change the disk's mode from "slave" to "standalone persistent"
- D. Change the configuration mode of the disk from "thin" to "normal"

Answer: C

NEW QUESTION # 43
TAP is a virtual network device independently maintained in Linux.1

- A. TRUE
- B. FALSE

Answer: A

Explanation:
According to the Huawei HCIA-Cloud Computing training materials, the statement is TRUE. TAP (Network TAP) is a virtual network kernel device that is part of the standard Linux kernel networking stack.2 It is
"independently maintained" because it is a native Linux feature, not a proprietary tool built solely for a specific hypervisor like KVM or Xen. TAP devices operate at the Data Link Layer (Layer 2) of the OSI model, meaning they handle Ethernet frames.3 In a cloud computing environment, TAP devices are fundamental for bridging the gap between virtual machines and the physical network.
When a Virtual Machine is created, the hypervisor (CNA in Huawei's case) creates a TAP device on the host. One end of this TAP device is "plugged" into the virtual machine's NIC, while the other end is connected to a virtual switch (like the DVS or Linux Bridge). This allows the VM to send and receive Ethernet frames as if it were connected to a physical switch port.
Linux maintains TAP alongside its counterpartTUN(which operates at Layer 3/Network Layer).4Because TAP carries full Ethernet headers, it is the preferred device for virtual switches, as it allows for features like VLAN tagging and MAC address learning.
Huawei's virtualization technology leverages these standard Linux kernel features to provide a high-performance, stable networking environment. Understanding that TAP is a standard, independent Linux kernel component is vital for candidates, as it explains how open-source foundations are used to build enterprise-grade cloud platforms like FusionCompute.

NEW QUESTION # 44
On Linux, which of the following is an absolute bath representing a file storage location?

- A. ./home/test
- B. ./test
- C. home/test
- D. ../ ../test

Answer: C
