

C1000-194시험난이도 - C1000-194인기덤프문제

ExamPassdump의IBM인증 C1000-194덤프의 인지도는 아주 높습니다. 인지도 높은 원인은IBM인증 C1000-194덤프의 시험적중율이 높고 가격이 저렴하고 구매후 서비스가 끝내주기 때문입니다. ExamPassdump의IBM인증 C1000-194덤프로IBM인증 C1000-194시험에 도전해보세요.

IBM C1000-194 Exam Syllabus Topics:

Section	Weight	Objectives
Plan and Configure	26%	- Component setup and configuration - Best practices for component usage - Architecture, deployment and consumption models
Integration	21%	- Integration between internal products - External integration options
Business Requirements and Use Cases	22%	- Selecting appropriate components for requirements and use cases - Understanding business requirements - Robotic Process Automation capability - Document Processing capability - Content Services capability - Foundational services
Overview and Capabilities	31%	- Common tools - Value proposition of Cloud Pak for Business Automation - Decision Management capability - Workflow capability - Insights capability - Process Mining capability

C1000-194시험난이도 100% 시험패스 덤프자료

우리 ExamPassdump사이트에서 제공되는IBM인증C1000-194시험덤프의 일부분인 데모 즉 문제와 답을 다운받으셔서 체험해보면 우리ExamPassdump에 믿음이 갈 것입니다. 우리ExamPassdump의 제품을 구매하신다고 하면 우리는 최선을 다하여 여러분들한테 최고의 버전을 제공함으로 한번에IBM인증C1000-194시험을 패스하도록 하겠습니다. IT시험이라고 모두 무조건 외우고 장악하고 많은 시간을 투자해야만 된다는 사상을 깨게 될 것입니다.

최신 IBM Data and AI: Data and AI C1000-194 무료샘플문제 (Q44-Q49):

질문 # 44

What are the four building blocks that make up the main task routes for Content Collector?

- A. Task, Audit log, Error, Decision points and rules
- B. Decision points and rules, Collector, Error, Task

- C. Collector, Task, Audit log, Decision points and rules
- D. Task, Audit log, Error, Collector

정답: A

설명:

The correct answer is Task, Audit log, Error, and Decision points and rules. In IBM Content Collector, task routes define how collected content is processed, evaluated, logged, and handled when failures occur. A task performs a processing action, such as collecting, transforming, classifying, archiving, or otherwise acting on content. An audit log task records successful or unsuccessful execution details, supporting traceability and operational diagnostics. An error task route provides controlled handling for exceptions and failed processing paths. Decision points and rules introduce conditional routing so that documents can follow different processing paths based on metadata, document state, or defined conditions. Collector is not one of the four building blocks listed for main task routes in the answer set; it represents a functional role in ingestion, not the structural route element being tested. These elements define a governed, auditable processing path for content capture and disposition. Reference/topics: Content Collector, Task routes, Elements of a task route, Decision points and rules, Audit log task, Error task route.

질문 # 45

How should business rules be structured in Operational Decision Manager?

- A. Modularize rules to facilitate easier updates and maintenance.
- B. Consolidate all rules into a single decision table.
- C. Avoid using natural language to improve rule clarity.
- D. Hard-code values for all decision scenarios.

정답: A

설명:

The correct answer is C. Operational Decision Manager is designed to externalize, organize, govern, test, and evolve decision logic independently from application code. Business rules should therefore be modularized into appropriate decision services, rule projects, packages, ruleflows, decision tables, and rule artifacts. A decision service can be organized into a main rule project and optional standard rule projects to split business logic into several parts. Project hierarchy, project references, and rule packages make applications more modular. This structure improves maintainability because changes can be made to the relevant rules or projects without destabilizing unrelated decision logic. Hard-coding values defeats the purpose of a business rules management system. Avoiding natural language is incorrect because ODM's business rule authoring is built around business vocabulary and Business Action Language concepts. Consolidating all logic into a single decision table creates maintenance, performance, and governance problems. Modular rule structure supports traceability, governance, testing, versioning, and controlled deployment. Reference/topics: Operational Decision Manager, decision services, rule projects, modular rule design, rule packages, decision governance.

질문 # 46

What is a key advantage of using FileNet for Enterprise Content Management?

- A. Real-time analytics on documents.
- B. Advanced natural language processing.
- C. Scalable document repository management.
- D. High-speed parallel processing.

정답: C

설명:

The correct answer is B. FileNet Content Manager's core enterprise value is scalable, secure, repository-based management of business content. Repository services are the core of the content platform, supporting the capture, management, storage, and retrieval of business-related digital assets. Multiple repositories, called object stores, can be created and managed within a single system to meet business requirements, and object stores can store content in databases, file systems, or S3-capable storage. This makes FileNet a strong fit for enterprise content management workloads involving large document volumes, metadata models, versioning, security, retention integration, and content-centric business applications. Advanced natural language processing may be associated with newer AI capabilities around content, but it is not the fundamental ECM advantage being tested. High-speed parallel processing is not the defining FileNet capability. Real-time analytics can be delivered by analytics components such as Business Automation Insights, not by FileNet as its primary function. FileNet's differentiator is governed, scalable document and object

repository management. Reference/topics: Content Services, FileNet Content Manager, object stores, repository services, enterprise document management.

질문 # 47

What can be reviewed during a conformance check in Process Mining?

- A. System diagram
- B. Input data model
- C. Model fitness
- D. Input data quality

정답: C

설명:

The correct answer is A: Model fitness. IBM Process Mining conformance checking compares a data-derived process model with a reference model to determine how closely real process execution follows the expected process design. The Model Conformance panel visualizes fitness and conformance indicators, including similarity, fitness, minimum fitness, and maximum fitness. Fitness represents the percentage of represented cases in the data-derived model, while minimum and maximum fitness reflect the least and most similar cases when compared with the reference model. This is exactly the type of measurement reviewed during a conformance check. Option B, input data model, refers to the structure of input data but not the conformance result. Option C, system diagram, is not a Process Mining conformance artifact. Option D, input data quality, is important during ingestion and preparation, but it is not the specific conformance-check result being tested. In practice, model fitness helps analysts identify deviation, nonconforming paths, missing activities, unexpected activities, and gaps between designed and actual execution. Reference/topics: Process Mining, model conformance, reference model, fitness indicators, deviation analysis.

질문 # 48

What are the five key areas where Cloud Pak for Business Automation can assist in digitizing and automating business operations across an enterprise?

- A. Business insights, Logistics management, Content services, Supply-chain optimization, and Document processing
- B. Digital transformation, Content services, Logistics Automation, Predictive Analysis, and Operations optimization
- C. Workflow automation, Decision management, Content services, Document processing, and Business insights
- D. Workflow automation, Digital transformation, Policy optimization, Supply-chain automation, and Document processing

정답: C

설명:

The correct answer is C. Cloud Pak for Business Automation is organized around core automation capabilities that digitize and automate enterprise operations: workflow automation, decision management, content services, document processing, and business insights. Workflow automation orchestrates structured processes, human-assisted work, and case-management patterns. Decision management externalizes repeatable decisions into business rules and decision services. Content services provide governed document and enterprise content repositories. Document processing applies AI and machine learning to classify, extract, validate, and enrich document data. Business insights, through Business Automation Insights and Business Performance Center, processes operational event data and visualizes the indicators that matter to the business in near real time. The incorrect options introduce logistics, supply-chain optimization, or generic digital transformation labels that are not the five canonical CP4BA capability areas. A solution architect should map requirements to these five domains before selecting deployment patterns, integration mechanisms, and operational monitoring strategy. Reference/topics: CP4BA automation capabilities, Workflow Automation, Decision Management, Content Services, Document Processing, Business Automation Insights.
