dbt Labs dbt-Analytics-Engineering exam include all the important concepts leaving behind the stories to tell for some other time. For the complete and quick dbt Labs dbt-Analytics-Engineering preparation the dbt Labs dbt-Analytics-Engineering Exam Questions are the best study material. With dbt Labs dbt-Analytics-Engineering Exam Practice test questions you can ace your dbt Labs dbt-Analytics-Engineering exam preparation simply and quickly to pass the final dbt-Analytics-Engineering exam easily.

## dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q298-Q303):

### NEW QUESTION # 298

31. Your entire DAG looks like the image shown.

(Several stg\_ models appear upstream, feeding into int\_ and fct\_ models.) The question asks: "Was this modeling rule violated?"

Staging models dependent on other staging models"

- A. No
- B. Yes

**Answer: B**

Explanation:

In dbt's recommended layered modeling architecture, the staging layer is intended to provide a clean, one- to-one representation of raw source tables. Each stg\_ model should depend only on sources, not on other staging models. This ensures staging remains a simple, transparent layer where data is renamed, recast, standardized, and lightly transformed before being passed to intermediate and mart layers.

In the DAG shown, at least one staging model (for example, stg\_line\_items or stg\_tpch\_line\_items) appears downstream of another staging model, meaning a stg\_ model is referencing another stg\_ model. This violates dbt's recommended modeling practice, because it creates unnecessary complexity in the staging layer and reduces modularity and transparency. Downstream layers such as intermediate (int\_) and marts (fct\_) should be used to combine, enrich, or join multiple staging outputs.

When staging models depend on each other, it becomes harder to trace lineage, reduces clarity about where transformations occur, and complicates the entire DAG. The proper pattern is:

\* Sources # Staging (stg\_) # Intermediate (int\_) # Marts (fct\_)

Since the DAG shows staging models referencing other staging models, the rules have indeed been violated.

### NEW QUESTION # 299

You want to include a multi-paragraph description for a source. Which of the following approaches is the most suitable?

- A. Reference an external Markdown file within the source description.
- B. Utilize YAML's block scalar syntax (using |) to maintain formatting for multi-line descriptions.
- C. Write a longer description directly within the YAML file, breaking it across multiple lines.
- D. dbt documentation does not support multi-paragraph descriptions for sources.

**Answer: B**

Explanation:

The block scalar syntax in YAML allows for writing multi-line text blocks that preserve the original formatting

### NEW QUESTION # 300

"Isn't debugging harder with many smaller models in a DAG?" How would you address this concern expressed by a colleague?

- A. "Smaller models are easier to test individually, leading to faster issue identification."
- B. "Debugging is slightly harder, but the benefits outweigh the added effort."
- C. "Our DAG will be simple, so debugging model dependencies won't be a concern."
- D. "We'll rely extensively on snapshots to trace errors back to their origin."

**Answer: A**

Explanation:

Emphasize how modularity isolates problems and enables targeted testing. While the other options have some truth, option B presents the most convincing argument.

### NEW QUESTION # 301

You notice a pattern where warnings are generated for several models due to missing descriptions. How could you configure `dbt_project.yml` to fail these models instead when descriptions are absent?

- A. Add on-run-start and on-run-end hooks to perform custom checks
- B. Introduce a custom macro to validate model descriptions\_
- C. Set a project-level severity setting under the `tests:` section.
- D. Globally change the default warning behavior using the `warn-if:` configuration

**Answer: D**

Explanation:

The `warn-if:` configuration lets you escalate specific warnings to errors at the project level.

### NEW QUESTION # 302

Which of the following scenarios might warrant a `git rebase` instead of a standard `git merge` when integrating your changes into the main branch?

- A. Your branch has diverged significantly from the main branch with unrelated changes.
- B. You only want to include a subset of your feature branch commits in the main branch.
- C. You want to avoid a merge commit and keep a linear project history.
- D. You need to resolve complex merge conflicts that arise during a standard merge.

**Answer: A,C**

Explanation:

A Rebasing creates a more linear history, making it easier to trace changes over time. D. Rebasing allows for a cleaner integration when a feature branch contains intermingled changes that shouldn't all be merged.

### NEW QUESTION # 303
