[R1]interface GigabitEthernet0/0/0

[R1-GigabitEthernet0/0/0]ip address 10.1.1.1 255.255.255.0

#

[LSW1]interface GigabitEthernet0/0/1

[LSW2-Vlanif10]ip address 10.1.1.2 255.255.255.0

- A. TRUE
- B. FALSE

Answer: A

Explanation:
Comprehensive Explanation: In this configuration, LSW1 and LSW2 have trunk links that allow VLAN 10 to pass between them. When a ping is sent from R1, the frame is tagged with VLAN 10 on LSW2, and this tagged frame is forwarded to LSW1. Since the trunk allows VLAN 10, the tagged data frame is successfully received and processed by LSW1.

NEW QUESTION # 185
As shown in the figure, RTA uses NAT and has an address pool configured to implement many-to-many non- NAPT address

translation, so that hosts on the private network can access the public network.
Assume that the address pool has only two public IP addresses, which are translated for Host A and Host B.
If Host C wants to access the public network, which of the following statements is true?

- A. All hosts use public IP addresses in turn and can access the public network.
- B. No public IP address is assigned to Host C, and Host C cannot access the public network.
- C. RTA performs NAT based on the source port number of Host C, and Host C can access the public network.
- D. RTA assigns an interface address (200.10.10.3) to Host C, and Host C can access the public network.

Answer: B

Explanation:
Detailed Explanation: In a many-to-many non-NAPT (Network Address Port Translation) configuration, each private host requires a unique public IP address from the address pool. If only two public IP addresses are available and both are already in use by Host A and Host B, no IP will be available for Host C, preventing it from accessing the public network.
