## Valid Authorized SCAIP Exam Dumps - How to Prepare for Saviynt SCAIP: Saviynt Certified Advanced IGA Professional (Level 200)

Nowadays, it is hard to find a desirable job. A lot of people are forced to live their jobs because of lack of skills. So you must learn something in order to be washed out by the technology. Then our SCAIP study materials totally accord with your demands. With the latest information and knowledge in our SCAIP Exam Braindumps, we help numerous of our customers get better job or career with their dreaming SCAIP certification.

## Saviynt Certified Advanced IGA Professional (Level 200) Sample Questions (Q50-Q55):

### NEW QUESTION # 50

Which of the following actions will allow the EIC admin to launch the campaign once the user attributes change?

- A. Schedule a campaign to detect user updates
- B. Configure Trigger Campaign upon update under connection attributes
- C. This cannot be automated and the campaign needs to be launched manually
- **D. Configure User Update Rule to trigger the campaign**

### Answer: D

#### Explanation:

In Saviynt EIC, automation of campaigns based on identity changes is typically achieved using User Update Rules. These rules monitor changes in user attributes (such as department, role, manager, or status) and can trigger predefined actions when conditions are met.

Option A is correct because a User Update Rule can be configured to trigger a campaign when specific attribute changes are detected. This allows organizations to automatically initiate certification campaigns when critical identity attributes change, ensuring continuous compliance and governance without manual intervention.

Option B is incorrect because connection attributes are primarily used for provisioning and integration logic, not for triggering campaigns. Option C is partially valid in a general sense, but scheduled campaigns do not dynamically react to attribute changes—they run on predefined schedules regardless of changes. Option D is incorrect because Saviynt supports automation through rules. Thus, User Update Rules provide an event-driven mechanism to launch campaigns based on real-time user attribute changes, making

Option A the correct answer.

#### NEW QUESTION # 51

A customer requires provisioning of time-bound access through roles that should be revoked automatically after certain days from the day of assignment. What option in EIC will help the customer achieve this requirement?

- **A. Enable Time-bound for Roles in Global Configurations > Roles**
- B. Configure an Enterprise Role and enable timestamp under Role Details
- C. Configure an Emergency Access Role
- D. Configure Dynamic Attributes for Roles

**Answer: A**

Explanation:

In Saviynt EIC, time-bound access is a standard feature used to ensure that access granted to users is automatically revoked after a defined duration. This requirement is fulfilled by enabling the time-bound configuration for roles under Global Configurations > Roles (Option B). Once this setting is enabled, users can request roles with a specified start and end date, and Saviynt automatically deprovisions the access when the validity period expires.

This capability is essential for enforcing least privilege and compliance requirements, as it eliminates the need for manual revocation and reduces the risk of lingering access. The system leverages scheduled jobs to monitor and remove expired entitlements or roles. Option A is incorrect because Dynamic Attributes are mainly used for form customization and conditional logic, not for enforcing access expiration. Option C (Emergency Access Role) is designed for temporary elevated access but follows a different configuration pattern and use case. Option D is not a valid standard approach for enabling automatic revocation. Thus, enabling time-bound roles in global configuration is the correct and scalable solution.

#### NEW QUESTION # 52

EIC Admin encounters an error "Connection Name Specified in accountJSON is not found" while running the WSRETRY job. Which JSON needs to be corrected?

- A. Update the correct connection name in ImportAccountEntJSON
- B. Update the correct connection name in CreateAccountJSON
- **C. Update the correct connection name in ImportAccountJSON**
- D. Update the correct connection name in ImportUserJSON

**Answer: C**

Explanation:

The error message "Connection Name Specified in accountJSON is not found" clearly indicates that the issue is related to the accountJSON configuration, which directly corresponds to ImportAccountJSON in Saviynt REST connector terminology. This JSON is responsible for handling account import (reconciliation) operations, including defining the connection name, API endpoints, and parsing logic for retrieving account data.

The WSRETRY job is typically used to retry failed web service (REST) operations, especially related to account imports or provisioning failures. Since the error explicitly references accountJSON, it means the system is unable to locate the connection name defined within the ImportAccountJSON configuration. This usually happens when the connection name is either misspelled, mismatched with the ConnectionJSON configuration, or incorrectly referenced.

Other options are incorrect because CreateAccountJSON is used for provisioning (account creation), ImportUserJSON is for identity import, and ImportAccountEntJSON is primarily used for entitlement and combined account-entitlement imports. Therefore, correcting the connection name in ImportAccountJSON resolves this issue.

#### NEW QUESTION # 53

What are the filters available to view the SOD violations in the SOD Risk Evaluation Job? (Multi-Select)

- **A. Security System**
- **B. Ruleset**
- **C. Users**
- D. User Account Evaluation

**Answer: A,B,C**

Explanation:

In Saviynt EIC, the SOD (Segregation of Duties) Risk Evaluation Jobs are used to identify conflicts in user access that violate defined SOD policies. To efficiently analyze and review these violations, Saviynt provides several filtering options.

Users (A) is a valid filter that allows administrators to view SOD violations specific to individual users or a group of users. This is helpful for targeted investigations or audits.

Security System (B) is also a valid filter, enabling administrators to narrow down violations based on specific applications or systems. This is useful when analyzing risks within a particular application landscape.

Ruleset (C) is another important filter, as SOD violations are evaluated based on predefined rule sets.

Administrators can filter results based on specific rulesets to understand which policies are being violated.

Option D (User Account Evaluation) is not a standard filter in the SOD Risk Evaluation Job. It is more related to job execution scope rather than filtering results.

Thus, the correct answers are Users, Security System, and Ruleset, which are the primary filters for analyzing SOD violations.

#### NEW QUESTION # 54

The Helpdesk has set a new password for the user who called in for password reset assistance. Choose the correct configuration to share the password with the calling user

- A. Configure an email template in Change Password Notification configurations
- B. Setup User Update Rule and configure an email template
- C. Configure an email template in the Reset Password notification under password policy
- D. System automatically shares the password

**Answer: C**

Explanation:

In Saviynt EIC, password management includes configurable notification mechanisms to securely communicate password changes or resets to users. When a Helpdesk performs a password reset, the appropriate configuration to notify the user is through the Reset Password notification under Password Policy.

Option C is correct because Saviynt provides a dedicated Reset Password notification template within password policy configurations. This ensures that whenever a password is reset (either by user self-service or by Helpdesk), the system triggers the configured email template to notify the user. This template can include secure messaging and instructions related to the new password or next steps.

Option A is incorrect because the system does not automatically share passwords without proper configuration. Option B applies to change password scenarios initiated by users, not Helpdesk resets. Option D is not recommended, as User Update Rules are not designed specifically for password notification workflows.

Thus, configuring the Reset Password notification under password policy is the correct and secure approach.

#### NEW QUESTION # 55

.....

The SCAIP exam real questions are the ideal and recommended study material for quick and complete Saviynt SCAIP exam preparation. As a SCAIP Exam candidate you should not ignore the SCAIP exam questions and must add the Saviynt SCAIP exam questions in preparation.
