## Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q168-Q173):

### NEW QUESTION # 168

Universal Containers (UC) is considering updating their Salesforce Release Management process. Which three best practices should UC consider for Version Control? Choose 3 answers

- A. Maintain a single repository for applications with individual branches for projects.
- B. Maintain unrestricted access to the release sandboxes for all changes being deployed.
- C. Maintain separate developer branches for minor and major releases.
- D. Automation is a must with various application branches in the repository.
- E. Maintain a single-entry point for production from the master branch.

**Answer: A,C,E**

Explanation:

Explanation

Maintaining separate developer branches for minor and major releases, maintaining a single repository for applications with individual branches for projects, and maintaining a single-entry point for production from the master branch are three best practices that UC should consider for version control. These practices help to:

Isolate and manage different types of changes in separate branches, such as bug fixes, enhancements, or new features<sup>1</sup>.

Organize and track the code and configuration for each application and project in a logical and consistent way<sup>2</sup>.

Ensure that the master branch reflects the current state of production and that only tested and approved changes are deployed to production

### NEW QUESTION # 169

Universal Containers (UC) is developing a new Customer Community. Requirements for the Community are not fully defined. UC is planning on using an Agile methodology for this work and has promised delivery of the complete system in three months. What are two risks associated with this approach? Choose 2 answers

- A. Agile does not allow for changes to requirements, so customers might not like the resulting solution
- B. The functionality that can be delivered in 3 months is unknown, and may not meet the needs of the business
- C. Agile is not an appropriate development methodology for Customer Community implementations
- D. Given the lack of requirements and the three-month timeline commitment, the project may not be feasible

**Answer: B,D**

Explanation:

Explanation

Developing a new Customer Community with an Agile methodology and a three-month timeline poses some risks, such as the functionality that can be delivered in 3 months is unknown, and may not meet the needs of the business, and given the lack of requirements and the three-month timeline commitment, the project may not be feasible. Agile is an appropriate development methodology for Customer Community implementations, as it allows for iterative and incremental delivery of value. Agile also allows for changes to requirements, so customers can provide feedback and prioritize the most important features.

### NEW QUESTION # 170

An Architect is working on a Universal Containers project, and due to security concerns they cannot provide the Architect with production access. Instead, a central release management team will be responsible for performing production deployments for all development teams. How should an Architect leverage the Metadata API to ensure any metadata components necessary to deploy the project's functionality are properly communicated to the release management team?

- A. Provide the Release Management team a copy of the audit trail from the sandbox you wish to deploy from
- B. Create a change set in each sandbox and download the package.xml file for the release management team
- C. Provide a spreadsheet of all components and utilize the metadata API's readMetadata call
- D. Send a package.xml file with associated metadata in a .zip file to the Release Management team

**Answer: D**

### NEW QUESTION # 171

Universal Containers (UC) currently uses the org development model and utilizes the Salesforce CLI as the deployment tool. After the feature release artifact (a .zip file) has been tested in a lower sandbox, it is being deployed to the full sandbox for performance

testing and production deployment readiness check-Since quick deployment options are not being used, what is the correct way to deploy the artifact to the full sandbox?

- A. Authorize to the Full sandbox; validate with sfdx: source: deploy; On successful validation, deploy with sfdx:mdapi:deploy
- B. Authorize to the Full sandbox org; Validate with sfdx:mdapi:deploy; On successful validation, deploy with sfdx:source:deploy
- **C. Authorize to the Full sandbox org; Validate with sfdx:mdapi:deploy; On successful validation, deploy with sfdx:mdapi:deploy**
- D. Authorize to the Full sandbox org; Validate with sfdx:source:deploy; On successful validation, deploy with sfdx:source:deploy

**Answer: C**

Explanation:

The correct way to deploy the artifact to the full sandbox is to authorize to the full sandbox org, validate with sfdx:mdapi:deploy, and on successful validation, deploy with sfdx:mdapi:deploy. This is because the artifact is a .zip file, which is in the metadata API format, and not the source format. Therefore, the sfdx:mdapi:deploy command should be used instead of the sfdx:source:deploy command. See Deploy Metadata Using Metadata API for more details.

#### NEW QUESTION # 172

Universal Containers (UC) has a large user base (>300 users) and was originally implemented eight years ago by a Salesforce Systems Integration Partner. Since then, UC has made a number of changes to its Visual force pages and Apex classes in response to customer requirements, made by a variety of Vendors and internal teams. Which three issues would a new Technical Architect expect to see when evaluating the code in the Salesforce org? Choose 3 answers

- **A. Multiple unit test failures would be encountered.**
- B. Custom-built JSON and String manipulation Classes that are no longer required.
- C. Broken functionality due to Salesforce upgrades.
- **D. Multiple triggers on the same object, making it hard to understand the order of operations.**
- **E. Duplicated logic across Visual force pages and Apex classes performing similar tasks.**

**Answer: A,D,E**

Explanation:

Explanation

Multiple triggers on the same object can cause conflicts and performance issues. Multiple unit test failures can indicate poor code quality and lack of maintenance. Duplicated logic across Visualforce pages and Apex classes can lead to inconsistency and redundancy.
