질문 # 34

An organization's IT learn follows an API-led connectivity approach and must use Anypoint Platform to implement a System API that securely accesses customer data The organization uses Salesforce as the system of record for all customer data and its most important objective is to reduce the overall development time to release the System API The team's integration architect has identified four different approaches to access the customer data from within the implementation of the System API by using different Anypoint Connectors that all meet the technical requirements of the project Which approach should the team choose to meet the organization's objective to reduce the time to develop and release the System API?

- A. Use the Anypoint Connector for FTP to download a file containing a recent near-real time extract of the customer data
- **B. Use the Anypoint Connector for Salesforce to connect to the Salesforce APIs to directly access the customer data**
- C. Use the Anypoint Connector for HTTP to connect to the Salesforce APIs to directly access the customer data
- D. Use the Anypoint Connector for Database to connect to a MySQL database to access a copy of the customer data

정답: B

설명:

In an API-led connectivity approach, using the most efficient method to access system data can significantly reduce development time. Here's why using the Anypoint Connector for Salesforce is the best approach:

- * Direct Access:
 - * Salesforce APIs: The Anypoint Connector for Salesforce provides direct access to Salesforce APIs, allowing the System API to retrieve customer data efficiently and securely.
 - * No Middleware: Directly accessing Salesforce eliminates the need for intermediary steps, reducing complexity and potential points of failure.
 - * Reduced Development Time:
 - * Out-of-the-Box Functionality: The connector offers pre-built operations and functionalities tailored for Salesforce, speeding up development.
 - * Configuration Over Coding: Using the connector involves minimal configuration compared to coding custom integration logic, leading to faster implementation.
 - * Security:
 - * Built-in Security: The connector handles authentication and authorization, ensuring secure data access in line with Salesforce security protocols.
 - * Alternative Approaches:
 - * HTTP Connector: While functional, it requires more custom handling for Salesforce API interactions and error management.
 - * Database Connector: Accessing a database copy of Salesforce data may involve data synchronization challenges and does not provide real-time data.
 - * FTP Connector: Using FTP for data extracts is less efficient and introduces delays in accessing up-to-date information.

질문 # 35

Which AnypointPlatform component should a MuleSoft developer use to create an API specification prior to building the API implementation?

- A. API Designer
- B. MUnit
- C. API Manager
- D. Runtime Manager

정답: A

설명:

Creating an API specification before building the API implementation is a critical step in API development.

MuleSoft's API Designer is the tool designed for this purpose. Here's a detailed explanation:

- * API Designer:
- * Purpose: API Designer is a web-based tool within Anypoint Platform that allows developers to design, document, and test APIs.
- * Features:
- * Specification Languages: Supports RAML and OAS (OpenAPI Specification) for defining APIs.
- * Interactive Editing: Provides a graphical and text-based interface to design API specifications interactively.
- * Mocking Service: Allows developers to create mock services to simulate API behavior before the actual implementation.
- * Process:
- * Define API: Use API Designer to create a detailed API specification, including endpoints, methods, request/response schemas, and security schemes.
- * Documentation: Automatically generate API documentation that can be shared with stakeholders.
- * Testing: Test the API design using the built-in mocking service to ensure it meets requirements.

질문 # 36

In preparation for a digital transformation initiative an organization is reviewing related IT integration projects that failed for various reasons. According to MuleSoft's surveys of global IT leaders, what is a common cause of IT project failure that this organization may likely discover in its assessment?

- A. Reliance on an Integration-Platform-as-a-Service (iPaaS)
- B. Spending too much time on enablement

- C. Following an Agile delivery methodology
- **D. Lack of alignment around business outcomes**

정답: D

설명:

One common cause of IT project failure identified by MuleSoft's surveys of global IT leaders is the lack of alignment around business outcomes. Here's a detailed explanation:

* Lack of Alignment:

* Definition: This occurs when IT projects are not clearly linked to the organization's strategic goals and business objectives.

* Impact: Misalignment can lead to projects that do not deliver the intended business value, resulting in wasted resources and failed initiatives.

* Common Causes:

* Poor Communication: Lack of effective communication between business stakeholders and IT teams can lead to misunderstandings and misaligned priorities.

* Undefined Objectives: Projects without clearly defined business outcomes and success metrics struggle to demonstrate value and justify investments.

* Solution:

* Business-IT Collaboration: Foster strong collaboration between business and IT to ensure projects are aligned with strategic goals.

* Outcome-Focused Planning: Define clear business outcomes and success criteria at the outset of each project.

질문 # 37

A developer is examining the responses from a RESTful web service that is compliant with the Hypertext Transfer Protocol (HTTP/1.1) as defined by the Internet Engineering Task Force (IETF).

In this HTTP/1.1-compliant web service, which class of HTTP response status codes should be specified to indicate when client requests are successfully received, understood and accepted by the web service?

- **A. 2xx**
- B. 5xx
- C. 4xx
- D. 3xx

정답: A

질문 # 38

According to MuleSoft, what is a major distinguishing characteristic of an application network in relation to the integration of systems, data, and devices?

- A. It uses CI/CD automation for real-time project delivery
- B. It uses a well-organized monolithic approach with standards
- **C. It is built for change and self-service**
- D. It leverages well-accepted internet standards like HTTP and JSON

정답: C

설명:

An application network, as envisioned by MuleSoft, is designed to be dynamic and self-service, enabling rapid adaptation to changing business needs. Here's a detailed explanation:

* Built for Change:

* Flexibility: An application network allows for the easy addition, modification, and removal of services without disrupting existing functionalities.

* Modular Architecture: Promotes a modular approach where services and APIs can be independently developed, deployed, and managed.

* Self-Service:

* Empowerment: Enables different teams (e.g., developers, business units) to access and use APIs and services without heavy reliance on central IT.

- * API-led Connectivity: Facilitates a self-service model where reusable APIs are available for various teams to integrate and build upon, accelerating innovation and reducing time-to-market.
- * Characteristics:
 - * Decentralization: Unlike monolithic architectures, an application network supports decentralized development and deployment.
 - * Reusability and Discoverability: Services and APIs are designed to be easily discoverable and reusable across different parts of the organization.
