What are the key models in the IEC62443 series? - Answers -✓✓ Reference Model [ANSI/ISA-95]
Asset Model
Reference Architecture
Zone Model

Define "SL" and the 5 levels - Answers -✓✓ A measure of protection confidence, of IACS security and operational function [BaU]
0 = no protection requirements
1 = protection against unintentional violation
2 = protection against intentional violation
- means: simple
- capabilities: low
3 = protection against intentional violation
- means: sophisticated
- capabilities: moderate
4 = protection against intentional violation
- means: sophisticated
- capabilities: high

What is the application of the SLs within the relevant models? - Answers -✓✓ Overall: SLs assigned based on security requirements, i.e. considered AFTER the models have been "applied" to partition the IACS in question
Specifically: SL-Ts applied to zones and conduits, SL-As and SL-Cs considered during RA process [more on that later]

How can the models be used in IACS environments? - Answers -✓✓ They provide the basis and context upon which policies, processes and procedures are developed and applied to the assets [IACS]

What is the hierarchy/ or relationships between the models and what do they provide? - Answers -✓✓ Reference model = the overall conceptual basis
1. Policies, procedures and guidelines
2. Asset model = relationship between assets within the IACS
3. Reference architecture = operational, outlines elements/components within the different assets

ISA/IEC 62443 Cybersecurity Fundamentals Specialist Sample Questions (Q210-Q215):

NEW QUESTION # 210

Under User Access Control (SP Element 6), which of the following is included in USER 1 - Identification and Authentication?

- A. Password protection
- B. Backup restoration
- C. Incident handling and response
- D. Mutual authentication

Answer: A

Explanation:

SP Element 6 in ISA/IEC 62443-2-1 addresses User Access Control, ensuring that only authorized users can access IACS resources.

Step 1: Definition of USER 1

USER 1 corresponds to Identification and Authentication Control (IAC), the first foundational requirement. It focuses on verifying the identity of users before granting access.

Step 2: Password protection

Password mechanisms are a fundamental form of user authentication and are explicitly included under identification and authentication requirements.

Step 3: Why other options are incorrect

Mutual authentication applies to system-to-system authentication. Backup restoration and incident handling belong to different SP Elements.

Step 4: Security intent

By enforcing password protection, the asset owner ensures accountability, traceability, and prevention of unauthorized access. Therefore, the correct answer is Password protection.

NEW QUESTION # 211

Which of the following ISA-99 (IEC 62443) Reference Model levels is named correctly?

Available Choices (select all choices that are correct)

NEW QUESTION # 212

Multuser accounts and shared passwords inherently carry which of the following risks?

Available Choices (select all choices that are correct)

- A. Buffer overflow
- B. Privilege escalation
- C. Unauthorized access
- D. Race conditions

Answer: B

NEW QUESTION # 213

Which of the ISA 62443 standards focuses on the process of developing secure products?

Available Choices (select all choices that are correct)

- **B. 62443-4-1**
- C. 62443-3-2
- D. 62443-3-3

Answer: B

Explanation:

The ISA/IEC 62443 series of standards is divided into four main parts, each covering a different aspect of industrial automation and control systems (IACS) cybersecurity1:

* Part 1: Terminology, Concepts, and Models

* Part 2: Policies and Procedures

* Part 3: System Requirements

* Part 4: Component Requirements The part 4 of the series focuses on the requirements for the secure development and maintenance of products that are used in IACS, such as controllers, sensors, actuators, network devices, software applications, and cloud services. The part 4 consists of two standards1:

NEW QUESTION # 214

Which is a PRIMARY reason why network security is important in IACS environments?

Available Choices (select all choices that are correct)

- A. PLCs use serial or Ethernet communications methods.
- B. PLCs are programmed using ladder logic.
- C. PLCs are inherently unreliable.
- **D. PLCs under cyber attack can have costly and dangerous impacts.**

Answer: D

Explanation:

Network security is important in IACS environments because PLCs, or programmable logic controllers, are devices that control physical processes and equipment in industrial settings. PLCs under cyber attack can have costly and dangerous impacts, such as disrupting production, damaging equipment, compromising safety, and harming the environment. Therefore, network security is essential to protect PLCs and other IACS components from unauthorized access, modification, or disruption. The other choices are not primary reasons why network security is important in IACS environments. PLCs are not inherently unreliable, but they can be affected by environmental factors, such as temperature, humidity, and electromagnetic interference. PLCs are programmed using ladder logic, which is a graphical programming language that resembles electrical schematics. PLCs use serial or Ethernet communications methods, depending on the type and age of the device, to communicate with other IACS components, such as human-machine interfaces (HMIs), supervisory control and data acquisition (SCADA) systems, and distributed control systems (DCSs).
