

ZDTE Minimum Pass Score & ZDTE Best Study Material

What's more, part of that SurePassExams ZDTE dumps now are free: https://drive.google.com/open?id=1TxYUo1pVzeribyaZ4ALo0QTB3W4_AeVL

The Zscaler ZDTE test materials are mainly through three learning modes, Pdf, Online and software respectively. The ZDTE test materials have a biggest advantage that is different from some online learning platform which has using terminal number limitation, the Zscaler Digital Transformation Engineer ZDTE Quiz torrent can meet the client to log in to learn more, at the same time, the user can be conducted on multiple computers online learning, greatly reducing the time, and people can use the machine online of Zscaler Digital Transformation Engineer ZDTE test prep more conveniently at the same time.

Zscaler ZDTE Exam Syllabus Topics:

Topic	Details
Topic 1	Connectivity Services: Covers methods and technologies for connecting users and devices securely to the Zscaler cloud.
Topic 2	Platform Services: Details the core platform functionalities that enable security, scalability, and reliability.
Topic 3	Risk Management: Focuses on identifying, assessing, and mitigating risks to users and organizational assets.
Topic 4	Zscaler for Users - Engineer Overview: Covers the foundational understanding of Zscaler services from a user perspective and the engineer's role in managing them.
Topic 5	Cyberthreat Protection Services: Covers mechanisms for detecting, preventing, and mitigating cyber threats in real time.
Topic 6	Data Protection Services: Explains how sensitive data is secured, monitored, and managed within the platform.
Topic 7	Zscaler Zero Trust Automation: Explains automating security and access policies based on Zero Trust principles.
Topic 8	Zscaler Digital Experience: Covers monitoring and optimizing user experience across applications and network connections.
Topic 9	Access Control Services: Focuses on controlling and enforcing user access to applications and resources.
Topic 10	Identify Services: Explains how user identities are managed and integrated within Zscaler services.

ZDTE Best Study Material, ZDTE Exam Experience

To save resources of our customers, we offer real Zscaler Digital Transformation Engineer (ZDTE) exam questions that are enough to master for ZDTE certification exam. Our Zscaler ZDTE Exam Dumps are designed by experienced industry professionals and are regularly updated to reflect the latest changes in the Building Zscaler Digital Transformation Engineer (ZDTE) exam content.

Zscaler Digital Transformation Engineer Sample Questions (Q29-Q34):

NEW QUESTION # 29

How can Zscaler ThreatParse, in conjunction with information about the MITRE ATTandCK framework, assist security analysts in determining the attacker's objectives?

- A. It provides suggestions on risk management strategies provided by the framework.
- B. It conducts natural language reconstruction of attacks by summarizing and translating log information into plain English.
- C. It prioritizes the log information according to the latest campaign in the MITRE ATTandCK framework.
- D. It maps into the framework to evaluate the probability of a financial loss.

Answer: B

Explanation:

ThreatParse is part of Zscaler's advanced cyberthreat analysis capabilities, used primarily within Zscaler Deception and related SecOps workflows. Zscaler describes ThreatParse as an investigative engine that takes raw attack or event logs and "reconstructs" the attack sequence, summarizing what happened and translating the data into plain, human-readable language so even junior analysts can quickly understand the incident.

In addition, ThreatParse enriches these reconstructed attacks with structured information tied to the MITRE ATTandCK framework, including tactic and technique identifiers plus an associated risk score. This linkage helps analysts recognize why the attacker is performing certain actions (for example, credential access, lateral movement, or data exfiltration) rather than just what they did.

By combining natural-language reconstruction with MITRE ATTandCK context, ThreatParse effectively turns low-level events into a clear narrative aligned with attacker tactics and objectives. Analysts can quickly see which stage of the kill chain the adversary is in, the severity of the behavior, and which threats demand immediate attention. Options B and C are incorrect because ThreatParse does not perform financial-loss modeling or generic risk-management recommendations; option D is inaccurate because its primary value is narrative reconstruction plus ATTandCK mapping and risk scoring, not simply prioritizing logs by "latest campaign."

NEW QUESTION # 30

How many minutes of data can the Log Streaming Service retransmit once the connection is restored between App Connectors and Zscaler Private Access (ZPA)?

- A. Last 15 minutes
- B. Last 30 minutes
- C. Last 60 minutes
- D. Last 20 minutes

Answer: A

Explanation:

Zscaler Private Access (ZPA) uses the Log Streaming Service (LSS) to deliver ZPA logs (such as user activity and connector/authentication logs) to external SIEM and analytics platforms. LSS relies on a ZPA App Connector as the local relay between the ZPA service and the downstream log receiver. If network connectivity between ZPA and the local App Connector is interrupted, log delivery may be temporarily disrupted.

According to Zscaler integration guidance, when connectivity between ZPA and the local App Connectors is restored, LSS can retransmit up to 15 minutes of previously undelivered log data, although this retransmission is not guaranteed in all circumstances. This limited replay window is designed to provide reasonable resilience for short outages without requiring large local storage on the connector.

The 15-minute buffer applies specifically to ZPA log streaming scenarios and is distinct from longer-term log retention in Zscaler's logging cluster or external SIEM. Options A, C, and D overstate the supported replay duration and do not match Zscaler's documented behavior. To minimize log gaps beyond this 15-minute window, Zscaler recommends resilient network paths for App

Connectors and careful monitoring of connector health so that LSS can operate continuously.

NEW QUESTION # 31

When using a Domain Joined posture element to allow access in a ZPA Access Policy, which statement is true?

- A. If a 2nd domain and a sub-domain are needed in the Access Policy rule you must create a 2nd posture profile with the other domain and add it to the Access Policy.
- **B. When a ZPA Browser Access client attempts to access an application, Zscaler can determine if that device is joined to a particular domain.**
- C. Only some Linux operating systems have Domain Joined posture profile support in Zscaler.
- D. Zscaler ZPA can contact the IDP such as Azure AD out-of-band to verify if a device is joined to a particular domain.

Answer: B

Explanation:

The Domain Joined posture element in ZPA evaluates whether a device belongs to a specific Active Directory domain. ZPA performs this evaluation using the device's local posture signals, either through the Zscaler Client Connector posture engine or through the browser-based posture evaluation framework used in ZPA Browser Access. When a user connects via Browser Access, ZPA can still determine domain membership by inspecting the allowed browser posture attributes provided by the endpoint, enabling device-based Zero Trust controls without requiring a full Client Connector installation.

Linux endpoints do not support domain-joined posture verification, making option A incorrect. Domain join validation is performed at the device level, not through the Identity Provider, because IdPs validate users, not device domain status, eliminating option D. ZPA's posture configuration allows you to define multiple domains within a single posture profile, so creating a second posture profile is unnecessary, making option C incorrect.

Therefore, the correct statement is that ZPA Browser Access can determine whether the device is joined to the specified domain, which aligns with the expected behavior of the domain-joined posture element.

NEW QUESTION # 32

How many apps and risk attributes can be monitored using Zscaler's Shadow IT and Data Discovery feature?

- A. 30K apps and 80 risk attributes
- B. 10K apps and 5 risk attributes
- C. 50K apps and 75 risk attributes
- **D. 100K apps and 200 risk attributes**

Answer: D

Explanation:

Zscaler's Shadow IT and Data Discovery capabilities are delivered primarily through its multimode CASB and data protection services. Shadow IT Discovery automatically identifies unsanctioned cloud applications in use and evaluates them across a large set of risk attributes (for example, security controls, compliance posture, data handling, and business continuity).

Updated Zscaler training and exam content for the Digital Transformation Engineer track describes a significantly expanded cloud app catalog, allowing visibility into up to 100,000 applications and evaluation across approximately 200 risk attributes. This scale is necessary to cover the rapidly growing SaaS ecosystem and to give security teams the granularity needed to distinguish between low-risk and high-risk services.

Earlier public materials referenced smaller catalogs (for example, 8,500 apps with 25 attributes), but the current exam-aligned figures reflect the evolution of Zscaler's data protection and Shadow IT intelligence.

Options A, B, and C therefore underrepresent the scope of Zscaler's catalog and risk model. In the context of the ZDTE curriculum, the correct pairing is 100K apps and 200 risk attributes, which best matches how Zscaler positions its Shadow IT and Data Discovery capabilities for broad visibility and fine-grained risk analysis.

NEW QUESTION # 33

An engineer attempted to push a configuration using an API call to an endpoint but received a 409 response code.

What was the reason for the error response code?

- **A. Edit conflict occurred**
- B. Resource does not exist

- C. Request is not complete due to incorrect syntax
- D. Exceeded the rate limit or quota

Answer: A

Explanation:

In the context of Zscaler's public APIs, HTTP status code 409 indicates a conflict with the current state of the target resource, most commonly an edit conflict. When configuration is managed via API, Zscaler uses versioning or similar concurrency controls to ensure that two administrators or systems do not overwrite each other's changes unintentionally. A 409 response typically appears when the payload being pushed is based on an outdated version of the object or when another change has been committed between the time the configuration was retrieved and the time the update was sent.

The Digital Transformation Engineer documentation explains that clients should first retrieve the latest configuration (often including a version or ETag-like value), apply their modifications, and then push the update. If the server detects that the version in the request no longer matches the current version, it returns

409 Conflict to signal that the update cannot be safely applied.

The other options map to different HTTP codes: rate limit or quota issues are indicated by 429 Too Many Requests, non-existent resources by 404 Not Found, and syntax or malformed payloads by 400 Bad Request

. Thus, for a 409 response during a configuration push, the correct interpretation is an edit conflict.

NEW QUESTION # 34

.....

Purchasing a product may be a cautious thing for all of us, because we not only need to consider the performance of the product but also need to think about the things after purchasing. Our product will provide free demo for trying, and after you have bought the product of the ZDTE exam, we will send you the product by email in ten minutes after we have received the payment. After you bought the practice materials for the ZDTE Exam, if you have any question in the process of using, you can ask the service staff for help by email. Free update for having bought product is also available.
