Exam4Docs's Cisco 300-420 Exam Training materials provide the two most popular download formats. One is PDF, and other is software, it is easy to download. The IT professionals and industrious experts in Exam4Docs make full use of their knowledge and experience to provide the best products for the candidates. We can help you to achieve your goals.

The next step to do is to take Cisco 300-420. These 300-420 practice questions can help you measure your skill to see if it has already met the standard set by Cisco 300-420. To optimize the effectiveness, We have made the 300-420 Practice Test using the same format as the Designing Cisco Enterprise Networks exam. All Cisco Exam Dumps questions appearing on the mock test are the ones we carefully predicted to appear on your upcoming exam.

Pass Guaranteed 2026 Cisco 300-420: Unparalleled Exam Designing Cisco Enterprise Networks Format

300-420 pdf file is the most favorite readable format that many candidates prefer to. You can download and install 300-420 pdf torrents on your PC or phone. If you are tired of the way to study, you can also print 300-420 pdf dumps into papers which can allow you to do marks as you like. As we all know, the 300-420 study notes on the papers are easier to remember. What's more, we use Paypal which is the largest and reliable platform to deal the payment, keeping the interest for all of you.

Cisco Designing Cisco Enterprise Networks Sample Questions (Q345-Q350):

NEW QUESTION # 345

Which component of Cisco SD-Access integrates with Cisco DNA Center to perform policy segmentation and enforcement through the use of security group access control lists and security group tags?

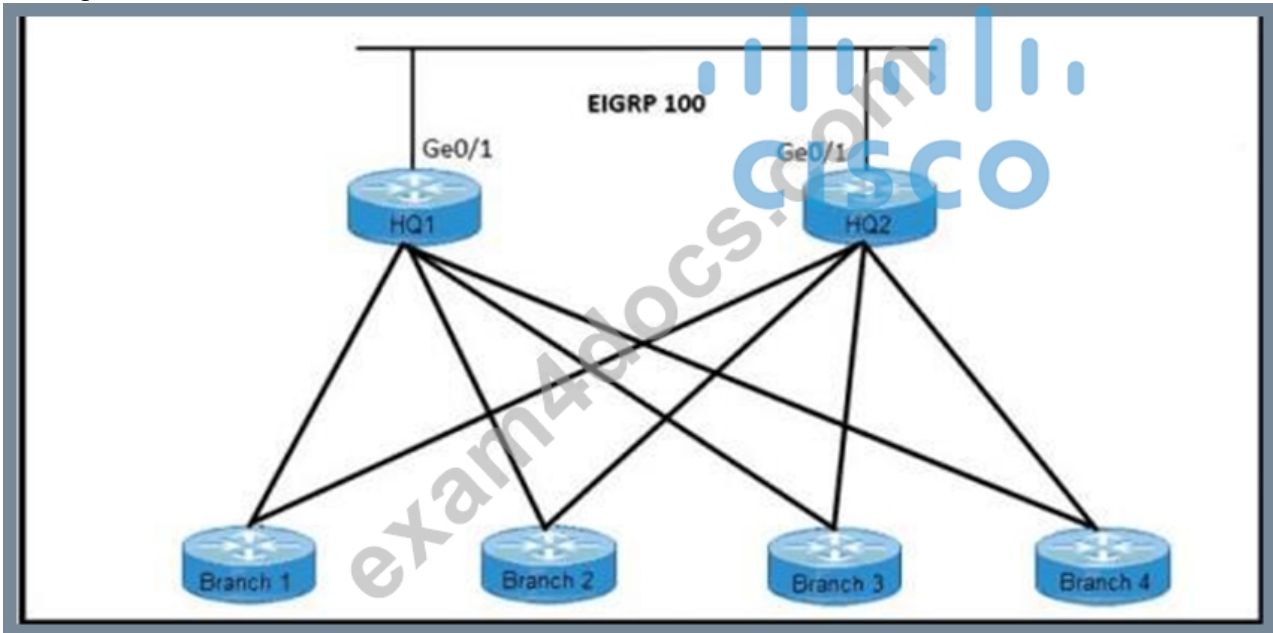

- A. Cisco Application Policy Infrastructure Controller Enterprise Module
- B. Cisco Identity Services Engine
- C. Cisco TrustSec
- D. Cisco Network Data Platform

Answer: C

Explanation:

Section: Advanced Enterprise Campus Networks

NEW QUESTION # 346

Refer to the exhibit. An architect must create a stable and scalable EIGRP solution for a customer. The design must:

- *conserve bandwidth, memory, and CPU processing
- *prevent suboptimal routing
- *avoid any unnecessary queries

Which two solutions must the architect select? (Choose two.)

- A. stub routing
- B. distribute lists
- C. static redistribution
- D. prefix lists
- E. route summarization

Answer: A,E

Explanation:

Route summarization and EIGRP stub routing are the two correct design techniques for a stable and scalable EIGRP deployment. Summarization reduces the number of prefixes advertised upstream, conserves bandwidth and memory, hides route flaps behind the summary boundary, and reduces the size of the EIGRP topology table. Stub routing prevents branch or access devices from being used as transit routers and limits the scope of EIGRP queries. This is critical because uncontrolled EIGRP query propagation can increase convergence time and processing load, especially in larger hierarchical networks. Prefix lists and distribute lists can filter routes, but filtering alone does not provide the same query-boundary and topology-hiding benefits as summarization and stubs. Static redistribution increases complexity and can create loop or policy risks if not controlled with tags and metrics. The question specifically asks to conserve bandwidth, memory, and CPU, prevent suboptimal routing, and avoid unnecessary queries; summarization and stub routing are the direct Cisco design answers. The architect should summarize at hierarchy boundaries and configure access or branch routers as EIGRP stubs where they should not provide transit. Reference topics: EIGRP summarization, EIGRP stub routing, query scope, hierarchical routing.

NEW QUESTION # 347

An engineer must design an in-band management solution for a customer with branch sites. The solution must allow remote management of the branch sites using management protocols over an MPLS WAN. Queuing is implemented at the remote sites using these classes:

- Class1 equals voice traffic 0
- Class2 equals mission-critical traffic
- Class3 equals default traffic

How must the solution prioritize the management traffic over the WAN?

- A. Mark the traffic with DSCP CS2 and map into Class2 with a minimum bandwidth assigned by reducing the bandwidth available to Class3

- B. Mark the traffic with DSCP CS1 and map into Class2 with a minimum bandwidth assigned by reducing the bandwidth available to Class3.
- C. Mark the traffic with DSCP CS6 and map into Class1 with a minimum bandwidth assigned by reducing the bandwidth available to Class2
- D. Mark the traffic with DSCP EF and map into Class1 with a minimum bandwidth assigned by reducing the bandwidth available to Class2.

Answer: A

NEW QUESTION # 348

Drag and drop the characteristics from the left onto the correct telemetry mode on the right.

The collector initiates a session to the device	Dial-In
supports TCP, UDP, and gRPC	
The device initiates a session to the collector	Dial-Out
supports gRPC only	

Answer:

Explanation:

The collector initiates a session to the device	Dial-In
supports TCP, UDP, and gRPC	
The device initiates a session to the collector	Dial-Out
supports gRPC only	

Explanation:

Dial-In: collector initiates a session to the device; supports gRPC only. Dial-Out: device initiates a session to the collector; supports TCP, UDP, and gRPC.

Model-driven telemetry can operate in dial-in or dial-out mode, and the distinction is based on which side initiates the session and how the subscription is established. In dial-in telemetry, the collector initiates a session to the network device and dynamically subscribes to the required sensor paths. This is useful when the collector wants direct control over the subscription lifecycle. Cisco telemetry documentation commonly associates dial-in with gRPC-based dynamic subscriptions on supported platforms. In dial-out telemetry, the device initiates the session toward the collector based on a configured subscription. The subscription exists in the device configuration, and the device streams telemetry data to the configured destination without requiring the collector to start the connection. This design is useful when devices are behind NAT, firewalls, or operational models where the network device should push telemetry to a known collector. Therefore, the mapping is: dial-in equals collector-initiated and gRPC-only in this context; dial-

out equals device-initiated and supports the listed transport options. This distinction is central to Cisco model-driven telemetry design.

NEW QUESTION # 349

Drag and drop the properties from the left onto the Cisco SD-WAN components that perform them on the right.
