

Pass Guaranteed 2026 SOA-C02: AWS Certified SysOps Administrator - Associate (SOA-C02)–The Best Valid Exam Vce Free

DOWNLOAD the newest Itcerttest SOA-C02 PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1pmAcGBZYAbrsK6COz8pDfeRZSATatHyK>

Are you still worried about your coming SOA-C02 exam and have no idea what to do? Are you too busy to study with all the books and other broad exam materials which will take you a long time to prepare for your exam? You can just choose to buy our SOA-C02 Exam Questions which have settle all these problems for you. And our pass rate of the SOA-C02 study materials is high as 98% to 100%. Hence they are your real ally for establishing your career pathway and get your potential attested.

The SOA-C02 Exam is an updated version of the previous SOA-C01 exam, which was retired by AWS on July 1, 2021. The new exam covers the latest AWS services and features, including AWS Organizations, AWS Control Tower, AWS Systems Manager, and AWS Config. It also tests the candidate's ability to monitor and troubleshoot AWS services, as well as their knowledge of security and compliance best practices.

High Pass-Rate SOA-C02 Valid Exam Vce Free to Obtain Amazon Certification

If you decide to buy our SOA-C02 study questions, you can get the chance that you will pass your SOA-C02 exam and get the certification successfully in a short time. For we have helped tens of thousands of our customers achieved their dreams. We believe you won't be the exception, so if you want to achieve your dream and become the excellent people in the near future, please buy our SOA-C02 Actual Exam, it will help you.

Amazon SOA-C02 Exam is a certification offered by Amazon Web Services (AWS) for individuals interested in becoming a certified sysops administrator. SOA-C02 exam is designed to test the candidate's knowledge and skills in deploying, managing, and operating scalable, highly available, and fault-tolerant systems on the AWS platform. The SOA-C02 exam is the latest version of the AWS Certified SysOps Administrator - Associate (SOA) certification, which is highly regarded in the industry.

Amazon SOA-C02 (AWS Certified SysOps Administrator - Associate) certification exam is designed for IT professionals who are responsible for deploying, managing, and maintaining applications on AWS. AWS Certified SysOps Administrator - Associate (SOA-C02) certification validates your skills in deploying, managing, and operating scalable, highly available, and fault-tolerant systems on AWS. It also demonstrates your understanding of AWS architecture and services, as well as your ability to automate operational tasks and troubleshoot issues.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q105-Q110):

NEW QUESTION # 105

A SysOps administrator is responsible for a legacy, CPU-heavy application. The application can only be scaled vertically. Currently, the application is deployed on a single t2 large Amazon EC2 instance. The system is showing 90% CPU usage and significant performance latency after a few minutes. What change should be made to alleviate the performance problem?

- A. Change the Amazon EBS volume to Provisioned IOPs
- **B. Upgrade to a compute-optimized instance**
- C. Purchase Reserved Instances
- D. Add additional t3. large instances to the application

Answer: B

NEW QUESTION # 106

A company migrated a two-tier web application from an on-premises environment to AWS by using a rehost strategy. The company hosts the web tier on Amazon EC2 instances in a public subnet. The instances have Elastic IP addresses. The database tier is a single EC2 instance that runs Microsoft SQL Server. All the resources are in one Availability Zone.

A SysOps administrator must implement a new architecture to improve the application's security and make the application highly available. The new architecture must require minimum application code changes and administrative overhead.

Which combination of steps will meet these requirements? (Choose two.)

- A. Place the web-tier instances in an Auto Scaling group. Configure the Auto Scaling group in multiple AWS Regions. Deploy the EC2 instances into private subnets that are behind an internet-facing Application Load Balancer.
- **B. Use AWS Database Migration Service (AWS DMS) to migrate the database EC2 instance to Amazon RDS for SQL Server with Multi-AZ Database Mirroring (DBM).**
- C. Launch an additional EC2 instance to host SQL Server. Place the new database EC2 instance in a second AWS Region. Enable replication between the two database EC2 instances.
- D. Use AWS Database Migration Service (AWS DMS) to migrate the database EC2 instance to Amazon DynamoDB.
- **E. Place the web-tier instances in an Auto Scaling group. Configure the Auto Scaling group to support a Multi-AZ deployment into private subnets that are behind an internet-facing Application Load Balancer.**

Answer: B,E

Explanation:

Migrating the web tier into an Auto Scaling group deployed in private subnets behind an internet-facing Application Load Balancer improves security by limiting direct internet exposure and enhances availability via Multi-AZ deployment.

Migrating the SQL Server database from an EC2 instance to Amazon RDS for SQL Server with Multi-AZ deployment using Database Mirroring minimizes administrative overhead while increasing the database tier's availability.

NEW QUESTION # 107

A company has a new requirement stating that all resources in AWS must be tagged according to a set policy.

Which AWS service should be used to enforce and continually identify all resources that are not in compliance with the policy?

- A. Amazon Inspector
- B. AWS Systems Manager
- C. AWS CloudTrail
- **D. AWSConfig**

Answer: D

NEW QUESTION # 108

A company has deployed AWS Security Hub and AWS Config in a newly implemented organization in AWS Organizations. A SysOps administrator must implement a solution to restrict all member accounts in the organization from deploying Amazon EC2 resources in the ap-southeast-2 Region. The solution must be implemented from a single point and must govern an current and future accounts. The use of root credentials also must be restricted in member accounts.

Which AWS feature should the SysOps administrator use to meet these requirements?

- A. AWS Security Hub conformance packs
- **B. AWS Organizations service control policies (SCPs)**
- C. AWS Config aggregator

- D. IAM user permissions boundaries

Answer: B

Explanation:

To restrict EC2 resource deployment in a specific region and restrict root credentials usage:

Create Service Control Policies (SCPs):

Use AWS Organizations to create SCPs that restrict actions for all member accounts.

Create an SCP to deny the creation of EC2 instances in the ap-southeast-2 region.

Create an SCP to deny the use of root credentials in member accounts.

Reference:

Attach SCPs:

Attach the SCPs to the organizational units (OUs) or directly to the accounts as needed.

This approach provides centralized control over account policies, ensuring compliance across current and future accounts.

NEW QUESTION # 109

An organization created an Amazon Elastic File System (Amazon EFS) volume with a file system ID of fs-85ba4Kc. and it is actively used by 10 Amazon EC2 hosts. The organization has become concerned that the file system is not encrypted. How can this be resolved?

- A. Enable encryption on the existing EFS volume by using the AWS Command Line Interface
- B. Enable encryption on each host's local drive. Restart each host to encrypt the drive.
- **C. Enable encryption on a newly created volume and copy all data from the original volume. Reconnect each host to the new volume.**
- D. Enable encryption on each host's connection to the Amazon EFS volume. Each connection must be recreated for encryption to take effect.

Answer: C

NEW QUESTION # 110
