CompTIA Security+ Certification Exam Sample Questions (Q702-Q707):

NEW QUESTION # 702

The marketing department set up its own project management software without telling the appropriate departments. Which of the following describes this scenario?

- A. Service disruption
- B. Shadow IT
- C. Data exfiltration
- D. Insider threat

Answer: B

Explanation:

Explanation: Shadow IT is the term used to describe the use of unauthorized or unapproved IT resources within an organization. The marketing department set up its own project management software without telling the appropriate departments, such as IT, security, or compliance. This could pose a risk to the organization's security posture, data integrity, and regulatory compliance.

NEW QUESTION # 703

A company is currently utilizing usernames and passwords, and it wants to integrate an MFA method that is seamless, can integrate easily into a user's workflow, and can utilize employee-owned devices. Which of the following will meet these requirements?

- A. Offline backup codes
- B. Phone call
- C. Push notifications
- D. Smart card

Answer: C

Explanation:

Push notifications offer a seamless and user-friendly method of multi-factor authentication (MFA) that can easily integrate into a user's workflow. This method leverages employee-owned devices, like smartphones, to approve authentication requests through a push notification. It's convenient, quick, and doesn't require the user to input additional codes, making it a preferred choice for seamless integration with existing workflows.

NEW QUESTION # 704

Which of the following is most likely associated with introducing vulnerabilities on a corporate network by the deployment of unapproved software?

- A. Hacktivists
- B. Shadow IT
- C. Script kiddies
- D. Competitors

Answer: B

Explanation:

Shadow IT refers to the use of information technology systems, devices, software, applications, and services without explicit IT department approval. This is the most likely cause of introducing vulnerabilities on a corporate network by deploying unapproved software, as such software may not have been vetted for security compliance, increasing the risk of vulnerabilities.

NEW QUESTION # 705

A company is concerned about weather events causing damage to the server room and downtime. Which of the following should the company consider?

- A. Clustering servers
- B. Load balancers
- C. Off-site backups
- D. Geographic dispersion

Answer: D

Explanation:

Explanation

Geographic dispersion is a strategy that involves distributing the servers or data centers across different geographic locations.

Geographic dispersion can help the company to mitigate the risk of weather events causing damage to the server room and downtime, as well as improve the availability, performance, and resilience of the network. Geographic dispersion can also enhance the disaster recovery and business continuity capabilities of the company, as it can provide backup and failover options in case of a regional outage or disruption.

The other options are not the best ways to address the company's concern:

Clustering servers: This is a technique that involves grouping multiple servers together to act as a single system. Clustering servers

can help to improve the performance, scalability, and fault tolerance of the network, but it does not protect the servers from physical damage or downtime caused by weather events, especially if the servers are located in the same room or building³.

Load balancers: These are devices or software that distribute the network traffic or workload among multiple servers or resources. Load balancers can help to optimize the utilization, efficiency, and reliability of the network, but they do not prevent the servers from being damaged or disrupted by weather events, especially if the servers are located in the same room or building⁴.

Off-site backups: These are copies of data or files that are stored in a different location than the original source. Off-site backups can help to protect the data from being lost or corrupted by weather events, but they do not prevent the servers from being damaged or disrupted by weather events, nor do they ensure the availability or continuity of the network services.

NEW QUESTION # 706

Which of the following would help reduce alert fatigue?

- A. Penetration testing
- B. Rule tuning
- C. Log aggregation
- D. Compensating controls

Answer: B

Explanation:

Adjusting and refining detection rules reduces false positives and irrelevant alerts, ensuring that security teams receive only meaningful notifications and thereby minimizing alert fatigue.
