

# XSIAM-Engineer Study Materials & XSIAM-Engineer Exam Preparatory & XSIAM-Engineer Practice Test

BONUS!!! Download part of UpdateDumps XSIAM-Engineer dumps for free: <https://drive.google.com/open?id=10kjdC-witl6gDwe8iHe7TtJN27Va32aJ>

A good deal of researches has been made to figure out how to help different kinds of candidates to get XSIAM-Engineer certification. We revise and update the XSIAM-Engineer test torrent according to the changes of the syllabus and the latest developments in theory and practice. We base the XSIAM-Engineer Certification Training on the test of recent years and the industry trends through rigorous analysis. Therefore, for your convenience, more choices are provided for you, we are pleased to suggest you to choose our XSIAM-Engineer exam question for your exam.

## Palo Alto Networks XSIAM-Engineer Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> <li>• <b>Planning and Installation:</b> This section of the exam measures skills of XSIAM Engineers and covers the planning, evaluation, and installation of Palo Alto Networks Cortex XSIAM components. It focuses on assessing existing IT infrastructure, defining deployment requirements for hardware, software, and integrations, and establishing communication needs for XSIAM architecture. Candidates must also configure agents, Broker VMs, and engines, along with managing user roles, permissions, and access controls.</li> </ul>
Topic 2	<ul style="list-style-type: none"> <li>• <b>Content Optimization:</b> This section of the exam measures skills of Detection Engineers and focuses on refining XSIAM content and detection logic. It includes deploying parsing and data modeling rules for normalization, managing detection rules based on correlation, IOCs, BIOCs, and attack surface management, and optimizing incident and alert layouts. Candidates must also demonstrate proficiency in creating custom dashboards and reporting templates to support operational visibility.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• <b>Integration and Automation:</b> This section of the exam measures skills of SIEM Engineers and focuses on data onboarding and automation setup in XSIAM. It covers integrating diverse data sources such as endpoint, network, cloud, and identity, configuring automation feeds like messaging, authentication, and threat intelligence, and implementing Marketplace content packs. It also evaluates the ability to plan, create, customize, and debug playbooks for efficient workflow automation.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• <b>Maintenance and Troubleshooting:</b> This section of the exam measures skills of Security Operations Engineers and covers post-deployment maintenance and troubleshooting of XSIAM components. It includes managing exception configurations, updating software components such as XDR agents and Broker VMs, and diagnosing data ingestion, normalization, and parsing issues. Candidates must also troubleshoot integrations, automation playbooks, and system performance to ensure operational reliability.</li> </ul>

## 100% Pass Quiz Trustable XSIAM-Engineer - Dumps Palo Alto Networks XSIAM Engineer Discount

Our XSIAM-Engineer test training will provide you with a well-rounded service so that you will not lag behind and finish your daily task step by step. At the same time, our XSIAM-Engineer study torrent will also save your time and energy in well-targeted learning as we are going to make everything done in order that you can stay focused in learning our XSIAM-Engineer Study Materials without worries behind. We are so honored and pleased to be able to read our detailed introduction and we will try our best to enable you a better understanding of our XSIAM-Engineer test training better.

### Palo Alto Networks XSIAM Engineer Sample Questions (Q22-Q27):

#### NEW QUESTION # 22

A SOC needs to automate the 'containment' phase of incident response for critical endpoints. This involves isolating the affected endpoint from the network. The current endpoint security solution (ESX) has an API for network isolation, but it requires a dynamically generated authentication token for each request, which expires every 5 minutes. The XSIAM playbook must successfully acquire this token and use it for the isolation command. How should the XSIAM playbook be designed to handle this dynamic token authentication securely and reliably?

- A. Hardcode a static, long-lived token obtained from ESX into the XSIAM playbook configuration.
- B. Disable token authentication on ESX to simplify the XSIAM integration.
- C. Configure XSIAM with the ESX API credentials, assuming XSIAM will automatically handle token refreshing.
- D. Manually retrieve the token from ESX and paste it into the XSIAM playbook each time it runs.
- E. Implement two sequential steps in the playbook: one to call the ESX authentication API to get the token, and a second step using the output of the first step to make the isolation API call.

**Answer: E**

Explanation:

For APIs requiring dynamic, short-lived tokens, the playbook must explicitly manage the token acquisition. Option B describes the correct pattern: the first step in the playbook calls the ESX authentication API to obtain the token, and the subsequent step(s) use this token (passed as an output from the first step) in the 'Authorization' header or body of the actual isolation API call. This ensures the token is fresh and valid for each execution. Hardcoding (A) is insecure and will fail. Manual input (C) is not automation. XSIAM does not automatically handle all external API token refreshes (D) unless specifically designed into a connector. Disabling authentication (E) is a severe security risk.

#### NEW QUESTION # 23

An XSIAM engineer is tasked with creating a custom automation workflow that, upon detection of a critical ransomware alert, automatically isolates the affected endpoint and creates a Jira ticket. Which sequence of XSIAM automation components is most appropriate to build this workflow, and what challenge might arise in the Jira integration?

- A. Log Ingestion Correlation Rule Automation Rule Playbook (with Cortex XDR action and Jira action)
- B. Dashboard Widget Scheduled Report Playbook (with email notification) External Script (for isolation and Jira)
- C. Incident Layout -> Manual Action Button Playbook (with Jira action) -> Built-in Cortex XDR action
- D. Alert Rule -> Automation Rule -> Playbook (with Cortex XDR action) -> Custom Integration (for Jira)
- E. Detection Rule -> Playbook (with Custom Integration for both isolation and Jira)

**Answer: A**

Explanation:

The most appropriate sequence for a fully automated response to a critical alert is: Log Ingestion (feeding data for detection) -> Correlation Rule (to identify the ransomware based on logs) -> Automation Rule (triggered by the correlation, initiating the playbook) -> Playbook (orchestrating the Cortex XDR isolation action and the Jira ticket creation). A common challenge with Jira integration, especially when dealing with structured security data, is correctly mapping the dynamic fields from XSIAM incidents (e.g., incident ID, affected host, alert details) to the potentially custom fields defined in Jira projects. This requires careful configuration of the Jira integration's mapper within the XSIAM content pack or playbook action parameters.

### NEW QUESTION # 24

A large enterprise's XSIAM deployment is generating a high volume of alerts. The SOC manager needs a dashboard to help prioritize incident investigations. This dashboard should display: 1) Alerts grouped by 'Threat Category' (e.g., Malware, Phishing), 2) A breakdown of 'Alert Severity' within each category, and 3) A 'Normalized Score' for each alert, calculated as (Severity\_Weight / Asset\_Criticality\_Score). The 'Asset\_Criticality\_Score' is derived from an external CMDB imported as a custom lookup. Which XQL operations and dashboard widget types are required to construct this prioritization dashboard? (Select all that apply)

dataset = alerts | group by threat\_category | count() by severity and a 'Grouped Bar Chart' or 'Stacked Bar Chart'.

dataset = alerts | lookup cmdb\_asset\_criticality\_lookup on asset\_id as asset\_criticality\_score | eval normalized\_score = severity\_weight / asset\_criticality\_score and a 'Table' widget.

dataset = alerts | timechart count() by threat\_category and a 'Trend' widget.

The lookup command for importing external CMDB data into XSIAM.

The eval command for calculating the normalized score.

- A. Option D
- B. Option A
- C. Option E
- D. Option B
- E. Option C

**Answer: A,B,C,D**

Explanation:

This question requires multiple XSIAM features for data manipulation and visualization. - Option A: Correctly uses `group by threat_category | count() by severity` and identifies appropriate chart types ('Grouped Bar' or 'Stacked Bar') to visualize alerts by category and severity breakdown. This addresses requirement 1 and 2. - Option B: Shows the correct approach for calculating the `normalized_score` by performing a `lookup on asset_id` to get `asset_criticality_score` and then using `eval` for the calculation. A 'Table' widget is suitable for displaying individual alerts with their normalized scores, aiding prioritization. This addresses requirement 3. - Option D: The `lookup` command is fundamental for enriching alert data with external CMDB information, which is explicitly stated as a requirement for calculating the normalized score. This is a necessary operation. - Option E: The `eval` command is essential for performing calculations, such as multiplying `severity_weight` by `asset_criticality_score` to derive the `normalized_score`. This is a necessary operation. Option C is incorrect because while `timechart` and 'Trend' widgets are useful, they don't directly address the specific grouping, breakdown, and normalized scoring requirements outlined for prioritization.

### NEW QUESTION # 25

A critical XSIAM automation rule is designed to automatically suppress 'Informational' severity incidents that match a specific set of criteria (e.g., source IP, specific message content). However, after deployment, you observe that some matching incidents are being suppressed, but others are not, even though they appear to meet the exact same criteria. There are no errors reported in the XSIAM automation logs. What is the most effective debugging strategy to pinpoint why certain incidents are being missed?

- A. Deconstruct the automation rule into smaller, isolated rules to test each condition individually and identify the failing one.
- B. Review the XSIAM 'Automation History' for the rule, looking for skipped executions or detailed logs on why a specific incident was not processed.
- C. Check for other, higher-priority XSIAM automation rules that might be executing first and altering incident properties before this suppression rule gets a chance to evaluate.
- D. Temporarily modify the automation rule to also 'tag' or 'comment' on incidents it would have suppressed, and then manually compare the properties of suppressed vs. unsuppressed incidents.
- E. Export the incident data (including all fields and properties) for both suppressed and unsuppressed incidents and perform a diff analysis to identify subtle discrepancies.

**Answer: C,E**

Explanation:

This scenario points to a subtle mismatch in conditions. If the rule sometimes works and no errors are reported, the issue lies in the data itself or the rule's evaluation logic. Exporting and diffing the full incident data (B) is highly effective because it allows for granular comparison of all fields, including potential hidden characters, different casing, or subtle formatting that might cause a condition mismatch. Option E is also critical: XSIAM automation rules execute in a specific order (priority-based). If another rule modifies an incident (e.g., changes a tag or field value) before the suppression rule evaluates, it could cause the suppression rule to miss incidents. Options A and D are useful for testing individual conditions but less efficient for subtle data discrepancies or execution order issues. Option C is useful if the rule failed, but here it's about missing incidents without explicit failure.

## NEW QUESTION # 26

A critical zero-day exploit emerges. Your organization needs to rapidly deploy a custom XSIAM content pack that performs multiple actions: block indicators on various security tools (firewall, EDR), scan endpoints for compromise, and notify affected users. Due to the urgency, the development is agile. Which of the following best practices should be adhered to for managing this content pack's lifecycle (development, deployment, and future updates) in a production XSIAM environment?

- A. Develop the content pack directly in the production XSIAM instance for speed, and once tested, export it as a ZIP for backup.
- B. Create individual playbooks for each required action (blocking, scanning, notifying) directly in production. This avoids the complexity of content packs during an emergency.
- C. Develop the content pack in a local IDE using the Demisto SDK. Manually upload and test the pack's artifacts (integrations, playbooks) directly to the production XSIAM instance as they are completed.
- **D. Develop the content pack in a dedicated development XSIAM instance. Utilize a version control system (e.g., Git) to manage the pack's source code. Implement CI/CD pipelines to automatically build and deploy the pack to a staging environment for testing, and then to production after successful validation.**
- E. Purchase a pre-built content pack from a third-party vendor that specifically addresses the zero-day, as custom development is too risky for urgent situations.

**Answer: D**

Explanation:

Option B describes the industry best practice for content pack development and lifecycle management, especially for critical, rapidly evolving content. Using a development instance, version control (Git), and CI/CD pipelines ensures that changes are tracked, tested thoroughly in a non-production environment, and deployed consistently and reliably to production. This approach minimizes risks, improves collaboration, and simplifies future updates. Option A, C, and E are high-risk approaches for production. Option D might be an ideal long-term solution but doesn't address the immediate need for a custom, rapid response pack.

## NEW QUESTION # 27

.....

You will also face your doubts and apprehensions related to the Palo Alto Networks XSIAM Engineer XSIAM-Engineer exam. Our Palo Alto Networks XSIAM-Engineer practice test software is the most distinguished source for the Palo Alto Networks XSIAM-Engineer Exam all over the world because it facilitates your practice in the practical form of the Palo Alto Networks XSIAM Engineer XSIAM-Engineer certification exam.
